12 HIGHLY CONFIDENTIAL  
13 VIDEOTAPED DEPOSITION OF MIRA KRISHNAN, Ph.D.  
14

15 TUESDAY, OCTOBER 6, 2020  
16 Volume 2  
17

18 Remote oral deposition of MIRA KRISHNAN, Ph.D.,  
19 conducted at the location of the witness in Grand  
20 Rapids, Michigan, commencing at approximately 9:03  
21 a.m., on the above date, before JULIANA F. ZAJICEK, a  
22 Registered Professional Reporter, Certified Shorthand  
23 Reporter, Certified Realtime Reporter and Notary  
24 Public.

1 THE VIDEOGRAPHER: We are now on the record. My  
2 name is David Lane, the videographer for Golkow  
3 Litigation Services.

4 Today's date is October 6th, 2020. The  
5 time is 9:03 a.m.

6 This deposition is taking place remotely  
7 in the matter of Flint Water Cases, restricted  
8 distribution, bellwether dis -- depositions.

9 Our deponent today is Dr. Mira Krishnan,  
10 Ph.D.

11 Our court reporter today is Juliana  
12 Zajicek. Counsel will be noted on the stenographic  
13 record.

14 Dr. Krishnan, I just want to remind you  
15 you are still under oath from yesterday.

16 THE WITNESS: Thank you.

17 THE VIDEOGRAPHER: Please begin.

18 MR. ROGERS: Thanks, Dave.

19 MIRA KRISHNAN, Ph.D.,  
20 called as a witness herein, having been previously  
21 duly sworn and having testified, was examined and  
22 testified further as follows:

23 EXAMINATION (Resumed)

24 BY MR. ROGERS:

1 Q. Good morning, Doctor.

2 A. Good morning.

3 Q. As I mentioned off the record before we  
4 got started, Mr. Lanciotti sent me an e-mail this  
5 morning which contains reference -- reference norms  
6 for the TMT and GPT tests that you administered to  
7 these bellwether plaintiffs, and I wanted to just get  
8 that on the record to make sure it's accurate and that  
9 we have it.

10 So remember -- you remember that  
11 discussion, of course, yesterday, right?

12 A. I do.

13 Q. So, the reference that I was provided is  
14 to a textbook by a Baron, I.S. from 2018 entitled  
15 "Neuropsychological Evaluation of the Child: Domains,  
16 Methods and Case Studies," Second Edition, Oxford  
17 University Press, is that correct?

18 A. That's correct.

19 Q. And that's the reference book that you  
20 referred to that has the normative values for the  
21 tests that we discussed, right?

22 A. Yeah, the -- the first and second editions  
23 of that book have the same references, but the table  
24 numbers are -- that were provided are for the second

1 edition.

2 Q. Okay. Thanks.

3 And what -- did you use the table numbers  
4 in your test normative scoring from the second  
5 edition?

6 A. That's correct. They are the same, it's  
7 the same data.

8 Q. Okay. And the further information is that  
9 for the TMT norms, they are at Table 10.08, Green --  
10 I'm sorry, the names in parentheses -- "(Spreen and  
11 Gaddes)", G-a-d-d-e-s. The Kindle location that you  
12 have is near 18903 and you -- and the page reference  
13 in a, I guess, would be the hard cover book would be  
14 524.

15 Is that all right?

16 A. To the best of my knowledge.  
17 Unfortunately the way that the Kindle book works, I'm  
18 not 100 percent sure the page number is correct, but  
19 the table number should be the same irrespective of  
20 version.

21 Q. Okay. And for the GPT test norms, that is  
22 Table 12.16, the author appears to be a Mr. Knight or  
23 Ms. Knights, K-n-i-g-h-t-s, and the Kindle location  
24 you referenced is 25675, the page number may be 710 in

1 the physical edition, right?

2 A. To the best of my knowledge, that's  
3 correct.

4 Q. Okay. And then there is a reference to  
5 the CW -- oh, sorry -- COWAT test, and a reference to  
6 a Table 9.21 in that same book. I don't recall our  
7 discussion yesterday of the COWA test. It says here  
8 on it e-mail that you mentioned it yesterday that you  
9 used it in similar evaluations but you don't believe  
10 you administered this particular test to any of the  
11 four bellwethers.

12 Tell me about that, what -- what's the  
13 story with that?

14 A. It's a test that I -- I am -- it is a test  
15 that I commonly use in this population. I -- I would  
16 have to go back and look at all of the reports, but I  
17 think it's possible that I used it in one of the 14  
18 children that I evaluated, but I went -- I went back  
19 and looked at these four reports. I didn't use them  
20 in these four. I provided it as a courtesy. It is  
21 the other norm that I might have used in one of these  
22 evaluations that's in that book.

23 Q. Okay. Thank you very much.

24 So having said that now and provided --

1 provided me with this information, you believe -- you  
2 have provided either in the test data reports  
3 themselves and/or with this information, the normative  
4 data for the other two tests as to which the test kits  
5 don't have the normative data, all of the information  
6 that would be related to the scoring and the norms for  
7 all of the tests and evaluations that you did, is that  
8 right?

9 A. I believe that's correct.

10 Q. Okay. So let's turn now to some other  
11 areas. I have sort of some general questions before  
12 we get into some of the specifics that I think would  
13 bear upon all of the plaintiffs, and it has to do with  
14 your diagnoses and -- and your opinion about --  
15 opinions about causation.

16 So, as I understand it, and correct me if  
17 I'm wrong, for all of these plaintiffs you hold the  
18 opinion and you've testified to the opinion and you've  
19 included it in your report that each of the  
20 plaintiffs -- as to each of the plaintiffs, that their  
21 impairments or the deficits that -- that you found in  
22 your testing were more likely than not the  
23 developmental lead exposure and that the source of the  
24 exposure was lead in the water.

1                   Is that a fair and accurate statement of  
2   what your opinions are?

3           A.     I stand by the opinions as they are  
4   originally written in the reports, but I believe that  
5   that's a fair summary.

6           Q.     Well, the reason I said it this way is  
7   that, you know, over the course of the day yesterday  
8   we delved into, you know, the language that you used  
9   in the reports and I'm sort of synthesizing it down to  
10   an opinion.

11                   So I'm going to say it again and then ask  
12   you some questions about it. And just tell me if this  
13   is -- you know, these are your opinions or not.

14                   So you hold the opinion -- opinions that  
15   for each of the plaintiffs the impairments or deficits  
16   that you found in your testing and evaluation of them  
17   were more likely than not the result of developmental  
18   lead exposure, is that right?

19           MS. CARO: Objection; the reports speak for  
20   themselves.

21                   You can answer.

22   BY THE WITNESS:

23           A.     Are you -- first, can you clarify, please,  
24   if you are referring to the four bellwethers that we

1 are currently discussing or some other group of  
2 bellwethers?

3 Q. Only these four.

4 A. Okay. I -- again, I stand by the reports,  
5 but I believe that in these four cases I did state  
6 that I believe -- I -- I believe that that is correct.

7 Q. And do you also hold the opinion with  
8 respect to these four plaintiffs that the source of  
9 the exposure to lead developmentally was lead in the  
10 water?

11 MS. CARO: Same objection.

12 BY THE WITNESS:

13 A. The -- I discussed this in detail with  
14 each of the reports. I am not aware of any other  
15 sources of lead exposure for these children.

16 Q. So, therefore, as I said, you hold the  
17 opinion that the source of lead exposure for these  
18 four bellwether plaintiffs was water, right?

19 A. Correct.

20 Q. So, I'm going to ask you some follow-up  
21 questions based on that opinion:

22 What evidence do you have that there were  
23 elevated levels of lead in the water that each of  
24 these plaintiffs consumed? And, again, it is the four

1 bellwethers that we are talking about here.

2 MS. CARO: Objection; asked and answered.

3 BY THE WITNESS:

4 A. We discussed this in great detail  
5 yesterday. I have stated repeatedly to you that the  
6 re -- the evidence that I reviewed is the evidence  
7 that is presented in each of the reports. I have -- I  
8 have summarized everything that I reviewed. I did not  
9 review anything that is not reported in any of the  
10 reports.

11 BY MR. ROGERS:

12 Q. No, but what specifically, what specific  
13 evidence do you have that the water that these  
14 individual plaintiffs drank had elevated lead levels  
15 in the water that they consumed?

16 MS. CARO: Objection; asked and answered.

17 BY THE WITNESS:

18 A. I am not an expert in water delivery.  
19 I -- I know that there are many experts -- I believe  
20 that there are many experts involved in this case that  
21 would know that area better than I do.

22 My basis is that these children have  
23 evidence of lead exposure and they are within the  
24 known distribution of lead exposure based on water in

1 the Flint, Michigan water system. I -- all other  
2 evidence is the evidence that I reviewed in the  
3 reports.

4 BY MR. ROGERS:

5 Q. Okay. When you referred yesterday to that  
6 same evidence, I think you were referring to, and  
7 correct me if I'm wrong, as to the -- them being in  
8 the areas where there was reported lead in the water,  
9 you referred -- or your basis for saying that or the  
10 evidence that you had of that was the  
11 Dr. Hanna-Attisha report from 2016.

12 Am -- am I right about that?

13 A. That's correct.

14 Q. Okay. So just -- I don't think we marked  
15 that yesterday. I'd like to mark this as our next  
16 exhibit.

17 MR. ROGERS: As I said off the record before we  
18 got started with Juliana, I -- we -- I marked your  
19 APPI TPI report as Exhibit 11 and then again as  
20 14. So this morning we are going to start with 15,  
21 just to make sure we have a clear record on it.

22 (WHEREUPON, a certain document was  
23 marked Mira Krishnan, Ph.D.

24 Deposition Exhibit No. 15, for

1 identification, as of 10/06/2020.)

2 BY MR. ROGERS:

3 Q. So I'm going to -- I do have the screen  
4 shared, is that right, can you see this coming up now?

5 A. I can see it, yes.

6 Q. Okay. So this is the Dr. Hanna-Attisha  
7 and other authors study that we just referred to that  
8 is now Exhibit 15.

9 This is the evidence that you have for  
10 there having been elevated lead levels in the water  
11 that the plaintiffs consumed, is that right?

12 A. In the case of these four children, to the  
13 best of my memory, I did not review any direct  
14 evidence of water samples from their homes, and so  
15 this is the only basis that I would have.

16 BY MR. ROGERS:

17 Q. Thank you. I'll close that out. I'm  
18 going to stop sharing at this time.

19 What evidence do you have that the amount  
20 of lead in the water that was consumed by these  
21 plaintiffs was to -- was sufficient in terms of amount  
22 and duration of its consumption to cause the types of  
23 disabilities and impairments or deficits that you have  
24 diagnosed them as having?

1 MS. CARO: Objection; beyond the scope of the  
2 expertise.

3 BY THE WITNESS:

4 A. I am not an expert in water, and my  
5 expertise, I -- I think I have been quite clear, is in  
6 clinical neuropsychology. I am using the lab data  
7 available in each -- in the case of each children --  
8 child, consisting of blood and bone lead levels.

9 BY MR. ROGERS:

10 Q. Okay. Ms. Caro, or Louise, I think when  
11 we discussed this subject yesterday, I asked you  
12 questions about the blood lead levels at least for the  
13 first two plaintiffs, that being S PPI and T PPI as  
14 having been negative, and I -- I think Louise's  
15 objection was something to the effect of, Well, that  
16 there isn't other evidence of blood lead levels for  
17 these children, so I wanted to follow up on that with  
18 you.

19 Are you aware of any evidence that these  
20 four bellwethers lead -- besides the blood lead level  
21 reports -- strike that. I'll start again. Sorry.

22 Are you aware of any other evidence  
23 besides the blood lead level test reports with respect  
24 to what were the actual or calculated or estimated

1 blood lead levels for these children?

2 A. I am not aware of any evidence that is not  
3 reviewed in my reports.

4 Q. And the evidence reviewed in your reports  
5 are the actual blood lead level test reports that were  
6 conducted on these children, correct, and nothing  
7 else?

8 MS. CARO: Objection; mischaracterization of  
9 testimony.

10 BY THE WITNESS:

11 A. They are the ones that -- they are the  
12 ones that I received for review.

13 BY MR. ROGERS:

14 Q. Right. So, therefore, the only evidence  
15 that you are aware of that you are -- have knowledge  
16 of as you sit here today as to what the blood lead  
17 levels were in these four children are contained in  
18 the test reports that you received and reviewed,  
19 correct?

20 A. Once again, I am not privy to any records  
21 that were reports or data that I didn't review in my  
22 reports. So the ones that are represented in the  
23 reports are the only ones to which I am privy.

24 Q. I understand that, but it's a simple

1 question.

2 The only evidence or information that you  
3 have, Doctor, as you sit here today, as to what the  
4 blood lead levels were in these four bellwether  
5 children at any time are the blood lead level test  
6 reports that you received and that you reviewed and  
7 that you've testified about so far, right?

8 A. I believe I've answered that question  
9 repeatedly, both yesterday and today. Yes.

10 Q. I want to talk briefly about your  
11 methodology. I think we covered this to some extent  
12 yesterday, but I just want to make sure we -- I'm  
13 clear on some things here.

14 Would you describe the methodology that  
15 you employed, that you used or carried out to  
16 determine whether the plaintiffs' impairments or  
17 deficits that you found in your testing and evaluation  
18 were causally linked or connected to their exposure to  
19 wat- -- the lead in the water?

20 A. I first interviewed the families and  
21 determined what their concerns or complaints about  
22 their children were. Then I completed behavioral  
23 observations and neuropsychological testing of the  
24 children. That included evaluation of their cognitive

1 and emotional skills. I used the data that I -- we  
2 discussed yesterday to obtain a general idea of the  
3 kinds of impairments that are commonly seen in this  
4 population, in addition to my own clinical experience  
5 and my general understanding of the human brain and  
6 neuropsychology, and I compared the impairments  
7 observed in the testing to the family complaints and  
8 to the range of impairments that are seen in lead  
9 exposure, and I also considered by way of differential  
10 diagnosis any other potential explanations for the  
11 phenomena that I was seeing as described in each of  
12 the individual reports.

13 Q. Okay. And how did you go about ruling out  
14 the other potential causes or sources of their  
15 impairments?

16 A. This is described in detail in the  
17 Conclusion section of each of the reports.

18 Q. Okay. So your methodology that you used  
19 to rule out other potential causes of the disabilities  
20 are as you described in the Conclusion section of your  
21 report and there is nothing else except what you  
22 reported there, is that right?

23 A. In general -- and neuropsychological  
24 reports can be hundreds of pages long if I write down

1 everything that I am thinking, but the high points are  
2 represented in the Conclusions.

3 Q. Do you recall having done anything other  
4 than what's in the Conclusions to rule out other  
5 potential causes of the disabilities or deficits that  
6 these children experience?

7 A. That is a fairly broad question. If there  
8 are specific alternate causes, I'm happy to discuss  
9 them with you.

10 Q. Well, you know, I -- it is a broad  
11 question, but what is your answer? I don't -- do you  
12 have an answer for me?

13 A. Generally speaking, neuropsychologists  
14 consider a range of possible options. I don't discuss  
15 ones that seem overly implausible or have no evidence  
16 or basis in any data, and so when I discuss the  
17 conclusions, I don't discuss the possibility that the  
18 children were tox -- were exposed to some other  
19 substances that I don't know about and that there is  
20 no suggestion that they were exposed to and I don't  
21 consider other things that are implausible based on  
22 their presentation. I considered the ones that are  
23 the most high likelihood alternative explanations in  
24 the Conclusion sections.

1           Q.     In terms of A[PPI] T[PPI], I have a few  
2 more questions following up on the end of our  
3 discussion yesterday, and that is, and I think you  
4 made mention of this, you noted in your interview or  
5 your report of the family history that there was a  
6 history of ADHD and anxiety for some of the members of  
7 her family.

8                     Is that right, do I have that right so  
9 far?

10          A.     The ADHD was in siblings and the anxiety,  
11 per my understanding, was in the plaintiff's mother  
12 after the water crisis began.

13          Q.     Okay. How -- how did you rule out, if at  
14 all, genetic predisposition as the cause of Ms. T[PPI]  
15 alleged -- or her neurocognitive and mood disorders  
16 that you diagnosed?

17          A.     We discussed this yesterday, but to  
18 reiterate what I said yesterday, first of all, I did  
19 not think that she had ADHD, and so the genetic  
20 inheritance of ADHD would not be relevant.

21                     I also did not think she had an anxiety  
22 disorder and so the genetic inheritance of anxiety  
23 would also not be relevant.

24          Q.     Did you -- you also noted in your report

1     that Ms. T PPI mother has bipolar disorder.

2                     Is that relevant in any way to any of the  
3     diagnoses for A PPI T PPI

4             A.     I do not see a mention of bipolar disorder  
5     in my report. Can you point out to me what you are  
6     looking at, please?

7             Q.     Yeah, let -- I will.

8                     That's not coming out clearly in my  
9     highlighting here on the report. Let's come back to  
10    that. During a break I'll find that reference for you  
11    and we'll come back to that one.

12                    Okay. Now let's do what we -- I had  
13    mentioned we were going to do earlier, and that is  
14    mark as Exhibit 16, and I'll share my screen so you  
15    can see it here, the section of the DSM-V that has to  
16    do with Other Specified Neurodevelopment --  
17    Neurodevelopmental Disorder.

18                    (WHEREUPON, a certain document was  
19                    marked Mira Krishnan, Ph.D.  
20                    Deposition Exhibit No. 16, for  
21                    identification, as of 10/06/2020.)

22    BY MR. ROGERS:

23             Q.     Is this -- take a look at this, and is  
24    this the diagnostic criteria that -- from the DSM-V

1 that you were referring to yesterday when you  
2 mentioned that you thought -- you felt that perhaps a  
3 more appropriate diagnosis would be other specified  
4 neurodevelopmental disorder versus mild cognitive  
5 disorder?

6 A. I discussed that in common clinical use  
7 these two terms are used somewhat interchangeably when  
8 the question is the impairment of cognitive functions  
9 in young children because they are in the  
10 developmental period, but this is the -- the  
11 alternative -- this is the other diagnostic material  
12 that I made reference to, yes.

13 Q. So just to be -- yeah.

14 So just to be clear, I think in three out  
15 of the four bellwether plaintiffs, that would be T<sup>PPI</sup>,  
16 V<sup>PPI</sup> and W<sup>PPI</sup>, in your reports you have a  
17 diagnosis of mild neurocognitive disorder, right?

18 A. I think that that is correct.

19 Q. And do you -- are you also -- and then  
20 because of our discussion, you said you had some  
21 clinical experience recently in discussions with  
22 colleagues or something to that effect that you had  
23 considered potential other appropriate diagnoses or  
24 terms for the diagnoses because they don't fit

1     squarely within that particular definition or  
2     diagnostic criteria.

3                     Do I have that right?

4             A.     As we discussed yesterday, the fundamental  
5     problem is that the DSM-V criteria for a  
6     neurocognitive disorder talks about decline from prior  
7     functioning, but in young children when there is a  
8     loss of functioning, it may not present as a decline  
9     because the skills are also developing during the time  
10    period in question. But, correct --

11            Q.     So --

12            A.     -- yes, this is something that we have  
13    discussed in the clinic recently.

14            Q.     So, what I'm trying to get to here is with  
15    respect to the three children in which you have in  
16    your report made a diagnosis of mild neurocognitive  
17    disorder, is there evidence that there was a decline  
18    from a pre -- in their functioning in that respect, a  
19    modest decline?

20            A.     There is evidence of a modest impairment  
21    in their functioning.

22            Q.     And -- but the modest impairment in their  
23    functioning, does that -- is there evidence that it  
24    declined from a previous level that they were

1 functioning at before?

2           A.       There is evidence that it is statistically  
3 unlikely that it -- that their general skill level  
4 would have predicted those skills that are impaired.  
5 There is no prior neuropsychological testing that I'm  
6 aware of in these specific cases. And so, because  
7 these children are developing and because there isn't  
8 prior cognitive data, I cannot explicitly point you to  
9 a quantitative basis for a prior level versus the  
10 current level.

11                   Many of these children were also very  
12 young during the times in question. And so, for  
13 instance, you don't talk about a decline in the  
14 reading skills of an eight-year-old who was exposed to  
15 lead at five because they were not expected to read at  
16 age five.

17           Q.       So when we go through the testing, which  
18 we'll do in a moment for APPI [REDACTED] TPPI [REDACTED] what you are  
19 saying is that, for some of the tests, anyway, there  
20 is evidence of an impairment of certain neurocognitive  
21 functions but that you are not able to say whether  
22 there was an actual decline from a preexisting level  
23 with respect to that particular skill, is that right?

24           A.       I'm saying that in most of these cases the

1 question of decline from a preexisting skill is  
2 irrelevant.

3 Q. Well, isn't it relevant to the issue of  
4 timing and causation, that is to say, what actually  
5 explains or accounts for that deficit?

6 MS. CARO: Objection; asked and answered.

7 BY THE WITNESS:

8 A. As I've explained several times both  
9 yesterday and today, when children are developing,  
10 these cognitive or other skills become available to  
11 them as they develop over time. These children were  
12 young at the time in question, ranging approximately,  
13 I believe, from age two or three with respect to the  
14 14 patients I examined, up to, I think, about age  
15 seven at the end of the crisis for the oldest children  
16 by just doing that math in my head.

17 But these children were all young when  
18 these things happened. So, generally speaking,  
19 neuropsychologists are interested not necessarily in  
20 loss of prior functioning, because the functions in  
21 question were generally developing over the course of  
22 time in question, but we are concerned with alteration  
23 of the trajectory of that development.

24 (WHEREUPON, a certain document was

1 marked Mira Krishnan, Ph.D.  
2 Deposition Exhibit No. 17, for  
3 identification, as of 10/06/2020.)

4 BY MR. ROGERS:

5 Q. Okay. Let's go to Exhibit 17, which I  
6 should be sharing.

7 Can you see this on your screen?

8 Doctor, I -- I just want to make sure you  
9 can see it?

10 A. I'm sorry. Who is Sharon?

11 Q. I am right now. Can you -- can you see  
12 it?

13 A. Oh, I can see it, yes.

14 Q. Yeah. Yeah. So --

15 A. I thought you were directing that question  
16 to someone other than me.

17 Q. Nope. I'm only -- only asking you  
18 questions today.

19 So, what I mentioned before was that I'm  
20 not going to mark your report separately. Actually,  
21 yeah, this one is. Okay. I stand corrected.

22 This Exhibit 17 contains both your full  
23 report on A[PPI] T[PPI], but it also has all of the  
24 data from the testing with it. What I mentioned was

1     when we get to the next two reports, I'm not going to  
2     re -- mark your report separately because it's  
3     contained in the report or the document with the raw  
4     data.

5                     So let me just get this view oriented  
6     correctly and we'll take a look at this.

7                     So, all of these raw data compilations,  
8     and they are all approximately 120 pages like this one  
9     is, they follow the same basic format, right, you have  
10    the raw data, the test reports, the scores and  
11    everything, and they all start out with this sort of  
12    cover sheet that describes what tests you  
13    administered, right?

14            A.     That's correct.

15            Q.     And show me on here, point out to me which  
16    of these would the -- would the norms for the scoring  
17    be contained in that textbook that we talked about?

18                     Is it this one right here that I'm  
19    highlighting, the -- can you see my cursor, the TMT?  
20    Oops.

21            A.     Yes, that's correct. That one and then in  
22    the third column at the top, GPT, the same two tests  
23    that we previously discussed.

24            Q.     I see.

1                   So, my cursor is going -- I'm not able to  
2   get my cursor over to the shared screen right now.

3           A.       I'm not an expert in IT either. Sorry.

4           Q.       No, I wouldn't -- okay. There is one  
5   where I'm not asking you the question. I need help  
6   from Dave on this one.

7           MR. ROGERS: Something happened, Dave, where I  
8   now can't get my cursor over to my shared screen.  
9   Let's go off the record for a second. Sorry about  
10   that.

11          THE VIDEOGRAPHER: Off the record, 9:33 a.m.

12                   (WHEREUPON, discussion was had  
13                   off the record.)

14          THE VIDEOGRAPHER: Back on record, 9:35 a.m.

15   BY MR. ROGERS:

16          Q.       Okay. Sorry about that snafu there. We  
17   are -- we are back in business here.

18                   So, with respect to the remainder of the  
19   tests, Doctor, besides the TMT and the GPT, the norms  
20   for scoring are all contained, as we discussed before,  
21   in the actual scoring kits for the individual tests  
22   that you described yesterday for -- for this  
23   particular plaintiff as well, right?

24          A.       In looking at the tests that were

1 administered, the tests are the same tests and the  
2 answers are the same answers as provided yesterday.

3 Q. Yeah. So, I mean, but with respect to the  
4 scoring and the answers, my question was: The same  
5 norms for scoring those are contained within the test  
6 kits themselves for each of the individual tests,  
7 right, the publishers of the test?

8 A. As we discussed yesterday, there was one  
9 of the tests where the norms are actually on the  
10 second page of the test and are so included in the  
11 document that I gave you, but for all of the others,  
12 yes, the norms are in the test kits or manuals.

13 Q. I -- I appreciate that. Thank you.

14 Remind me which one of those tests  
15 contains the norms for the scoring on the form itself,  
16 which one?

17 A. That's the Tower of London, Drexel  
18 Edition, it is indicated as TOL-DX in the left column.

19 Q. Got it. Thank you.

20 So, having looked at that, I want to go  
21 back to -- and this -- this should be a -- a little  
22 bit more efficient than the way we did it yesterday.  
23 I'm going to go to your report where it has all of  
24 these tests, and I know that you've summarized them in

1 a different section of the report, but if you wouldn't  
2 mind, just tell me for all of these tests in the  
3 section here on your report, Pages 5 through -- 5 and  
4 6, I guess, which ones did you find any abnormalities  
5 or deficits in your testing of APPI [REDACTED] TPPI?

6 A. So, I believe we discussed some of this  
7 already yesterday, but starting with the WISC-V --

8 Q. Uh-huh.

9 A. -- on the first page, the score SI = 5 is  
10 a similarities. It is a test of verbal reasoning that  
11 is impaired.

12 Q. Okay. If it's an SI 5 level, to what  
13 extent is that impaired?

14 A. Psychometrically it is considered mildly  
15 impaired.

16 Q. What would be the score that would be  
17 required for it to be not mildly impaired?

18 A. Are you asking for a score that would be  
19 considered normal or are you asking for a score that  
20 would be considered more than mildly impaired?

21 Q. No. You said it's -- she said -- you said  
22 that this score, 5, represents mildly impaired, right?

23 A. I did, yes.

24 Q. What would the score have to be in order

1 for it to be more normal than mildly impaired, the  
2 next level up?

3 A. Okay. That's -- that's the question that  
4 I just asked you. Seven or higher.

5 Q. Okay. Thank you.

6 Okay. Any others?

7 A. I discuss in the report some of the  
8 pattern differences, like the -- the pattern  
9 difference between word reading and math computation,  
10 but those scores are not considered impaired as  
11 discussed in the report.

12 The next impaired score is --

13 Q. I'm sorry --

14 A. -- is TMT-A which is --

15 Q. I'm sorry. Excuse me.

16 The word reading and the math computation,  
17 that's from the WRAT5, right?

18 A. That's correct.

19 Q. I -- I just wanted to make sure we aren't  
20 still in the WISC-V. Okay. So I understand what you  
21 are saying there. Yes.

22 Please go on. I -- were you on the TMT  
23 now?

24 A. Yes. So the TMT-A Z score of minus 1.8 is

1     impaired.

2           Q.     And what does that refer to?

3           A.     What do you mean, what does that refer to?

4           Q.     What -- what's the TMT-A?

5           A.     So this is a question I answered  
6 yesterday, but this is a test of --

7           Q.     Doctor, Doctor, Doctor, Doctor, Doctor,  
8 excuse me.

9                     So, when you -- when you keep interjecting  
10 this is an answer that I -- a question that I answered  
11 yesterday or you make comments to the effect like you  
12 did yesterday that any neuropsychologist would know  
13 the answer to this question, I'm going to ask you not  
14 to do that, okay, because it's -- it's causing delays  
15 and it's just not helpful.

16                    So I'm asking you the questions, I would  
17 like you to please answer my questions and not have  
18 the commentary about whether you've answered it before  
19 or whether anyone else would know the answer to the  
20 question, okay.

21                    Would you do me that favor going forward.

22                    So, please explain what is the TMT-A test  
23 about?

24           A.     It is a test of visual scanning and rapid

1 information processing.

2 Q. All right. And what -- is there other --  
3 any other test that reveals any other deficits for  
4 Ms. TPPI?

5 A. The next test is on the next page at the  
6 top.

7 Q. Okay.

8 A. So, this test has a number of different  
9 scores. If you scroll up a little bit so that you can  
10 see the top of the prior page, it begins where it says  
11 "NEPSY-2."

12 Q. Um-hum.

13 A. All of those scores are part of the same  
14 test and are discussed together in the preceding  
15 section, but the -- the test is called Auditory  
16 Attention and Response Set. It is a test of sustained  
17 attention and response vigilance. APPI did  
18 adequately with the easier component, which is  
19 auditory attention, that those are the scaled scores  
20 that are at the bottom of that page, but she was  
21 impaired with the more difficult condition response  
22 set which is at the top of Page 6.

23 Q. On all of those or just some of those that  
24 are listed there?

1           A.       The scores are considered -- I know that  
2     you don't want me to point out that I've -- we  
3     discussed this yesterday, but as I previously  
4     mentioned, neuropsychologists don't go through scores  
5     line by line and say this is impaired, this is intact,  
6     this is impaired, this is intact. I am answering your  
7     questions at your request, but this is not typically  
8     the way that people in my field consider the data.

9                   The correct total score in the first line  
10    and the combined total score in the last line are  
11    impaired. The overall result is one that I consider  
12    impaired.

13          Q.       Okay. Any others, meaning any other  
14    evidence of any deficits or impairments based on your  
15    testing?

16          A.       For the cognitive skills, no.

17          Q.       Are there some test results here that are  
18    supportive of or evidence of the mood disorder that  
19    you diagnosed in APPI [REDACTED] TPPI [REDACTED]

20          A.       That is primarily the BASC-3. The index  
21    scores are indicated here. If you would like to go  
22    through the line-by-line impairment, I would direct  
23    you to the BASC score report form which is much  
24    further down in the document. I believe it is on

1 Page 92 of the overall PDF file.

2 Q. Thank you. Let's do that.

3 Okay. I remember we looked at this  
4 similar type of form for Mr. SPPI [REDACTED], right. So,  
5 okay, yeah, explain this to me, please.

6 A. The general way that these scores are  
7 interpreted is the same. There are -- questions asked  
8 may vary slightly from child to child, although I  
9 believe that in the case of EPPI [REDACTED] and APPI [REDACTED], the  
10 ages are -- are close enough to the same that the same  
11 questions are being asked.

12 The -- the questions, again, decompose  
13 into different content areas of behavioral and  
14 emotional functioning and are adjusted based on the  
15 child's age at the time of report. And, again, as you  
16 see on the screen, the dark gray areas are considered  
17 clinically significant by the test publisher, the  
18 light gray areas are considered at risk, and  
19 percentiles are also included just below the bottom of  
20 where you are currently on the screen.

21 But so, as described in the report, the  
22 primary area that was impaired was the social skills  
23 area where APPI [REDACTED]'s social skills were described as  
24 worse than 97 percent of comparison population. There

1 are -- because these publishers use different  
2 standards for what is considered clinically  
3 significant, and we also consider the base rates of  
4 different kinds of disorders, it is common for  
5 psychologists and neuropsychologists to also look at  
6 some of the items that are in the light gray area,  
7 particularly to note if they fit a pattern, and so in  
8 APPI's case, her mother is also reporting fairly  
9 low levels of adaptability, fairly high levels of  
10 social withdrawal, and some other problems that are  
11 relatively more minimal.

12 Q. So remind me, that the BASC-3, is that a  
13 test that's administered by interviewing the parent?

14 A. It is a test that is a questionnaire that  
15 the parent fills out directly.

16 Q. That's right, okay. You told me that.  
17 You did tell me that yesterday, that's right.

18 Okay. And that's how you performed it or  
19 you had the mom do that in this case for Ms. TPPI,  
20 right?

21 A. That's correct.

22 Q. Okay. I think that concludes the  
23 questions for Ms. TPPI. Let's move on to RPPPI  
24 VPPPI.

1 MR. ROGERS: Let's mark as Exhibit 17 --

2 THE COURT REPORTER: Exhibit 18.

3 MR. ROGERS: Right. Thank you. Exhibit 18,  
4 this is the full record for your -- which includes  
5 your report, the forensic neuropsychological  
6 evaluation, and all of the underlying test data and  
7 reports for RPP1 VPP1. And as I did with the  
8 other plaintiffs, I'm going to ask you some background  
9 first.

10 (WHEREUPON, a certain document was  
11 marked Mira Krishnan, Ph.D.  
12 Deposition Exhibit No. 18, for  
13 identification, as of 10/06/2020.)

14 BY MR. ROGERS:

15 Q. So, as of the time of the evaluation which  
16 you did, and the evaluation was June 27th of this  
17 year, 2020, right?

18 A. Correct.

19 Q. And so that meant that RPP1 VaPP1,  
20 she was 6.8 years old or six years, eight months old,  
21 right?

22 A. Are you intending to share the screen at  
23 this point?

24 Q. I am. Sorry. You are right. I haven't

1 done that yet. Thanks.

2 Got it?

3 A. Yes.

4 Q. So she is six years, nine -- eight months  
5 old as of that time, and she had just finished the  
6 first grade, right?

7 A. Correct.

8 Q. I'm going to ask you some questions about  
9 what you know about her reported blood lead levels  
10 based on the reports that you reviewed and that you  
11 reported on in your report for RPPPI VPPPI

12 The first reference to a blood lead level  
13 is on Page 1, which I'm highlighting here, and similar  
14 to some of the reports that we saw yesterday, on  
15 November 3rd, 2014, there was a negative blood lead  
16 level assay test that was done, right?

17 A. That is my understanding, yes.

18 Q. And then the next one appears on Page 2.  
19 I'm highlighting it here. On the -- sorry -- I missed  
20 one up top here.

21 On September 2nd, 2015, the blood lead  
22 level was reported as .7, right?

23 A. That's my understanding based on reviewing  
24 the records.

1 Q. And then on January 14th, 2016, another  
2 blood lead level test was done and the amount was --  
3 the measurement was 1.3 micrograms per deciliter,  
4 right?

5 A. Again, that -- that is my understanding  
6 based on reviewing the records. I did not perform  
7 these blood assays.

8 Q. And then based on the records, the last  
9 one that you are aware of is this blood lead level  
10 that was done on May 22nd, 2017, .5 micrograms per  
11 deciliter, right?

12 A. To the best of my knowledge, the only  
13 other test after that was the bone lead test that is  
14 lower on that page.

15 Q. Right. But I -- I'm just -- based upon  
16 the information that you have, she was tested on  
17 May 22nd, 2017, and the blood lead level was .5,  
18 right?

19 A. Correct.

20 Q. And as we also discussed yesterday, is it  
21 also true that with respect to RPPPI v PPI  
22 blood lead levels that were measured and based on  
23 these test, you have not looked to do a -- or done an  
24 analysis of how that compares to averages for children

1 who at this point would have been between age one and  
2 three, right, national averages?

3 A. My answers to that questions -- that  
4 question are the same as they were yesterday, yes.

5 Q. Yes, meaning you haven't done that  
6 analysis, correct?

7 A. Correct.

8 Q. Okay.

9 Let's go to page -- the page that has your  
10 diagnosis, just as we did the other day for RPP1. Or  
11 just as we did yesterday with the other plaintiffs.

12 Okay. In your diagnosis, your diagnosis  
13 is: "...mild neurocognitive disorder...which is more  
14 likely than not a result of developmental lead  
15 exposure," right?

16 A. That is what the page says, yes.

17 Q. And I just wanted to make sure for RPP1  
18 that your testimony is the same concerning the Other  
19 Specified Neurodevelopmental Disorder from the DSM-V  
20 that we marked now I think as Exhibit 15.

21 Is there -- having considered it more, do  
22 you think that that's the more appropriate diagnosis  
23 than the one you have in your report?

24 A. I -- all -- all of my prior answers are --

1     apply to the same issues and the same issues are  
2     present with R[PPI]. There is a cognitive -- there is  
3     a cognitive problem that has the same issues of  
4     developmental nature that we discussed in the prior  
5     case with A[PPI].

6           Q.     So where do you come down on this, is it a  
7     blend of the two DSM criteria or is it the Mild  
8     Neurocognitive Disorder or is it the Other Specified  
9     Neurodevelopmental Disorder?

10          A.     I come down in believing that the DSM-V is  
11     not purely authoritative in defining the diagnostic  
12     criteria for disorders and that rather  
13     neuropsychologists should consider all of the  
14     available scientific evidence. But the way that the  
15     DSM-V describes the two disorders, the condition is  
16     really a blend of the two.

17          Q.     In what respect is it a blend?

18          A.     There is a mild impairment -- there is a  
19     modest impairment in cognitive functioning as  
20     described in the neurocognitive definition in the  
21     DSM-V and there is a developmental aspect to the  
22     disorder as described in the other condition.

23          Q.     I see.

24                 So with respect to R[PPI], is your answer

1 the same as it has been with -- with the other two  
2 plaintiffs, that in terms of determining whether there  
3 has been a decrease or a decrement in a prior level of  
4 cognitive performance, you are not aware or you don't  
5 have any evidence to support that for RPP[REDACTED]?

6 A. Again, as with the prior case of APPI[REDACTED],  
7 it's my opinion that that question is irrelevant  
8 because in RPP[REDACTED] case RPP[REDACTED] was 6-1/2 years old,  
9 approximately, when I saw her in 2020, and so during  
10 the time period in question, she was very young. In  
11 2015 she would have been 1-1/2 years old, and so, for  
12 instance, a child would not be expected to lose  
13 reading abilities that they had at 1-1/2 or attention  
14 abilities that they had at 1-1/2 because those  
15 abilities had not yet been developed.

16 Q. Okay. Let's go to your recommendations  
17 here, just as we did with the others yesterday.

18 You say with respect to RPP[REDACTED] that you  
19 estimate, do you see this section here?

20 A. Yes.

21 Q. Just like similar to what we looked at  
22 yesterday for one.

23 "I would estimate a 25-50% likelihood that  
24 RPP[REDACTED] may require future tutoring services (up to one

1 hour per day) or a future individualized education  
2 plan, although she is appropriate for placement in a  
3 mainstream classroom."

4 What is that based on?

5 A. The answer to that is -- is substantially  
6 the same as the answer I gave to the similar question  
7 previously, meaning that I do not have a direct source  
8 to provide you a quantitative specific estimate, but  
9 this is the best approximation I can make based on my  
10 clinical experience with this population.

11 Q. I think you described the evidence or the  
12 basis for that is your anecdotal experience with your  
13 clinical patients.

14 Is that true with respect to your estimate  
15 here for RPP? ?

16 A. Yes, similar to APPI case, I'm not  
17 aware of a large sample of children who have exactly  
18 the same cognitive profile from which I could draw an  
19 answer to that question, and I do not have a  
20 quantitative database of my own that I could use to  
21 answer that question.

22 Q. The second recommendation that you have  
23 here says, that I've highlighted now: "While IQ at  
24 the current age is not a completely predictive" --

1 "completely predictive of long-term outcome," what was  
2 her IQ measured in the FISQ (sic), actually, what was  
3 that?

4 A. It was 92.

5 Q. And where does that fit within the average  
6 or normal range or where does that fit?

7 A. It is average. It is a little lower than  
8 the other IQs that we discussed yesterday. I don't  
9 have a percentile in front of me, but it is somewhere  
10 around, I believe, the 35th percentile and so roughly  
11 two-thirds of children her age perform better than her  
12 and roughly one-third perform worse than her. That's  
13 my estimation without getting out a calculator.

14 Q. And so you say here that with -- "While IQ  
15 at the current age is not completely predictive of  
16 long-term outcome, individuals at this intellectual  
17 level are generally able to graduate from high school  
18 with a diploma."

19 What -- what's the "generally" refer to?

20 A. I did not see in RPP case factors that  
21 would cause me to think that she has a substantially  
22 statistically elevated likelihood of dropout.

23 Q. Okay. Thanks.

24 Is that true for college as well as high

1 school?

2 A. Based on my general knowledge, I think  
3 that it is -- it is not -- it is difficult to make a  
4 quantitative statement because RPPI is very young.  
5 She would go to college approximately 12 years from  
6 now, and I don't think that there is enough stability  
7 in testing at age six to make a strong statement about  
8 that.

9 Q. Is that also true with respect to her  
10 potential for success in a skilled vocation versus  
11 unskilled vocation?

12 A. So, the -- when I was a child my mom  
13 listened to a lot of financial television and they  
14 would say that the best predictor of future returns is  
15 past performance.

16 Given the data that I have available, the  
17 most reasonable assumption is that the deficits seen  
18 today would be deficits that would continue in the  
19 future. There is no assumption that is more justified  
20 by the evidence than that.

21 I think that there is probably some  
22 reduction in her functioning, but I am not able to  
23 provide a quantitative degree of that reduction. And  
24 I do think that some of the skills that she struggled

1 with would be important for many skilled vocations,  
2 but I am not able to quantify that.

3 Q. There was some information in some of the  
4 scientific literature that we looked at yesterday with  
5 respect to, some statistical data anyway, on increased  
6 risk for children diagnosed with ADHD that we talked  
7 about for EPPi SPPI [REDACTED]

8 Do you have any scientific literature or  
9 data with respect to the potential for RPPi [REDACTED]  
10 VPPi [REDACTED] to complete either high school, college or  
11 engage in skilled or unskilled vocations?

12 A. So, in RPPi [REDACTED] case I did not think that  
13 she had a current pattern that was consistent with  
14 ADHD. I also didn't see a clear pattern that was  
15 consistent with nonverbal learning disorder. That's  
16 discussed on the top of Page 8 of the report.

17 The reason I mention that is I believe  
18 that I also provided you references that discuss  
19 long-term outcomes from nonverbal learning disorder.  
20 I don't think that that is something that we discussed  
21 yesterday, but -- but that's the other closest source  
22 of information that I have available.

23 Q. Well, let me make sure I understand.

24 Do you or do you not think that based on

1 the evidence you can opine as to whether or not R~~PI~~,  
2 based on her testing and her -- the evaluation that  
3 you did, has an increased risk of graduating from high  
4 school or not?

5 A. I'm not able to quantify that.

6 Q. The same question with respect to college?

7 A. I'm not able to quantify that either.

8 Q. The same question with respect to engaging  
9 in a skilled vocation versus an unskilled vocation?

10 A. I am not able to quantify that either.

11 Q. What is the literature that you are  
12 referring to that has some analysis of the future  
13 potential for kids with, what was it, the deficit that  
14 she had that you just described?

15 A. There -- there -- I believe -- I have to  
16 look more closely at this literature, but I believe it  
17 is the Margolis reference that's in the -- the  
18 reference list I provided you.

19 Q. What -- what -- which specific deficit  
20 does that literature refer to or describe?

21 A. Nonverbal learning disorder.

22 Q. Okay. Let me just take a quick look at  
23 that.

24 So is that the 2020 paper, Margolis, et

1 al. "Estimated prevalence," et cetera?

2 A. Correct.

3 Q. I see.

4 Okay. Well, what I'm going to do, then,  
5 is I've already got all of the exhibits lined up and  
6 marked in order, so let me mark this one as -- I'll  
7 bring it up -- I'll share the screen so you can see  
8 it. And then we'll mark that one as -- let's see,  
9 I'll figure that out in a minute.

10 A. The -- but as I'm looking at that paper,  
11 it doesn't really provide any quantitative information  
12 about long-term outcomes, and so I think that the --  
13 the issue is really limited in terms of what we know  
14 or that what we have in the scientific literature to  
15 make statements, which I believe is what I had already  
16 said in answer to the prior question.

17 Q. All right. Well, we have the paper, so  
18 that's good. We don't need to mark it based on  
19 that -- that answer. Thank you.

20 Let's go back to the VPPi [REDACTED] child in  
21 terms of recommendations and -- and what the future  
22 might hold.

23 Do you remember yesterday that we  
24 discussed, at least for the ADHD diagnosis for

1 S[PPI], and I think also for the -- some of the  
2 deficits that T[PPI] A[PPI] T[PPI] exhibited, for any  
3 of the deficits that you found in R[PPI] V[PPI]  
4 that you've gone through in detail, are -- are there  
5 any specific coping mechanisms or teaching skills or  
6 treatment that would help her to enhance her  
7 performance in those areas in which she has deficits?

8 A. In R[PPI] case, it -- well, in R[PPI]  
9 case some of those deficits fell in areas that have to  
10 do visual processing and visual reasoning. What I had  
11 noted in my report was that while she had those  
12 deficits or lower scores in those areas, she had  
13 normal academic functioning, which is why I  
14 recommended that she may need an IEP in the future but  
15 that I wouldn't be able to recommend one at present.

16 So, in terms of treatments that are used  
17 for this kind of -- these kinds of thinking or  
18 learning problems, it is -- there -- so at the -- the  
19 Margolis paper that we started discussing talks about  
20 the issue that the condition is only now coming to a  
21 point where there is a clear prevalence estimate. And  
22 so in my experience, the -- the treatment is not as  
23 standardized as some other conditions for these  
24 nonverbal learning problems.

1                   What I recommend to patients that I see  
2   with these kinds of thinking problems are sometimes  
3   occupational therapy is helpful, occupational  
4   therapists have some skills in remediating visual  
5   kinds of tasks, functioning, sometimes I recommend  
6   that youth with these kinds of problems have extra  
7   emphasis in things like structured training in the  
8   arts, like drawing or painting, because that tends to  
9   enhance visual functioning.

10                  And then, if the child starts to show  
11   these problems in core academic areas in the future,  
12   which is typically they are seen in math, in the  
13   second to fourth grade kind of range, then -- then  
14   the -- the IEP recommendations would be for special  
15   education services or a response to intervention  
16   services is another term that teachers use that would  
17   remediate those skills at that time.

18                Q.     Are those treatment or compensa- -- go  
19   ahead, sorry. Are you going to say something else?

20                A.     Correct.

21                  Unlike ADHD, this is a condition that  
22   would not typically be treated with medications.

23                Q.     Yeah. Thank you.

24                  Are -- are those treatment modalities or

1 compensatory skills and extra tutoring and stuff of  
2 the type that you described generally successful?

3 A. In my experience, when children do these  
4 things, they do help. They -- they -- I don't know  
5 that I can make a quantitative statement about that,  
6 again, because of the lack of standardization of care  
7 in this area and because I don't have a database to  
8 make a quantitative statement based on myself, but,  
9 yes, they are generally beneficial.

10 Q. Are there any other deficits or  
11 impairments that you found in RPP1 that would be  
12 susceptible of treatment, compensatory-type approaches  
13 or anything, skilled teaching that you described for  
14 any of your -- her other deficits?

15 A. I am just looking at my report myself.

16 So the -- I did not see in her case a  
17 strong pattern of the frontal executive deficits that  
18 are seen in conditions like ADHD. There were some  
19 problems with aspects of learning that -- that, yes,  
20 would generally be amenable to interventions that have  
21 to do with teaching children meta -- meta cognition  
22 or -- or meta learning, meaning learning how to think  
23 or learning how to learn.

24 Q. Okay. Anything else? The question being:

1 Are there -- are there any --

2 A. That's it.

3 Q. Okay. Thank you.

4 Yesterday I asked you a question about  
5 since it's -- and I'll ask you about RPP1 now the  
6 same question.

7 Since it's your view that these deficits  
8 that you found were caused by developmental lead  
9 exposure, is it true that if there is no continuing  
10 exposure to lead for RPP1 VPP1 that the  
11 symptoms will diminish over time?

12 A. So, we had a -- we had a discussion about  
13 neuropsychologists lacking crystal balls yesterday and  
14 that certainly applies here as well.

15 In RPP1 case, there is -- was already  
16 evidence of peaking and reducing blood lead levels, as  
17 discussed in the Conclusion section of my report. If  
18 her levels continued to normalize, then, yes, I would  
19 suspect that there would be mitigation as a result of  
20 that, of any of these deficits.

21 Q. Okay. When you say that her results would  
22 normalize, I'm -- I want to make sure I understand.

23 What -- what do you mean by "normalize"?

24 A. I mean that if she continued to have blood

1     lead levels that trended in the direction of negative  
2     and stayed there, then I would expect that that means  
3     that her cumulative lead exposure period has now  
4     closed and that I would expect that gradually the lead  
5     that has accumulated in her body would circulate back  
6     into the blood and excrete and -- and as that happens  
7     I would expect that there may be some attenuation of  
8     any deficits that are being caused by lead.

9           Q.     Let's do what we did for -- with the other  
10    plaintiffs, looking at the actual scoring information  
11    for her. So I'll bring her record back up.

12           THE VIDEOGRAPHER: Don't forget to share your  
13    screen, David.

14           MR. ROGERS: Yeah, I got it. That should be up  
15    now. Thank you.

16    BY THE WITNESS:

17           A.     He's doing it right now.

18    BY MR. ROGERS:

19           Q.     It takes two clicks, so bear with me. It  
20    takes just a couple minutes here.

21           A.     Sure.

22           Q.     So I want to look at the raw test data for  
23    a minute and do what we did before. And I -- I know,  
24    listen, Doctor, to some extent this is somewhat

1 repetitive, but, please, just bear with me. I just  
2 want to do this in a certain pattern so that the  
3 record is clear.

4 So, I am now on the page of your report  
5 which summarizes the test results that are tabulated,  
6 and I'm just going to ask you if you would please tell  
7 me for which of these test results, point out to me  
8 the ones that report abnormalities or deficits that I  
9 know you've already described, but I want you -- want  
10 you to show me where they are on these tabulations of  
11 the results here, okay.

12 So would you please do that?

13 A. Could you please clarify? We were talking  
14 about R[PPI] v[PPI], but this is, I believe,  
15 D[PPI] w[PPI] report.

16 Q. You are right.

17 A. Have we changed topics?

18 Q. No, I didn't intend to, so that was a  
19 bad -- bad share. So let me get back to R[PPI]  
20 v[PPI], thank you, which is Exhibit 18. We'll  
21 get to w[PPI] in a minute, but you are 100 percent  
22 correct. Thank you.

23 A. I just saw numbers I didn't recognize  
24 because I was looking at a different report than you.

1 Q. Yep, you are right.

2 Okay. So here we are with R[PPI]

3 V[PPI]. So go through these test scores and

4 results here, the tabulations, and tell me which ones

5 are the ones where you found evidence of some deficits

6 or decrements?

7 A. Okay. You are not yet sharing your

8 screen.

9 Q. Oh, here we go again. Sorry.

10 A. Sorry.

11 Q. No. Thank you.

12 A. I hate to keep calling you out on that.

13 Q. No, no, please. Thank you for telling me.

14 Now can you see it?

15 A. Yes.

16 So, I mentioned with discussing A[PPI]

17 that, when we were talking about the BASC a moment

18 ago, I mentioned that we pay attention to scores that

19 are -- that cluster lower than other scores, in

20 addition to psychometrically impaired scores, and I'll

21 tell you briefly about both kinds of issues.

22 If you look at the WISC-V which is the

23 second test in the Tabulated Results section, Figure

24 Weight -- Figure Weights, FW, which is under -- so I

1 apologize for the abbreviations, but the third line  
2 under WISC-V, F1 Reas stands for Fluid Reasoning.  
3 These -- these are tests that have to do with novel  
4 problem solving using visual information. Figure  
5 Weights is the second one of those, FW, and that is  
6 psychometrically impaired.

7 The -- another visual spatial test was low  
8 average but not impaired, and that was BD on the line  
9 above, which is block design which is a task that  
10 requires construction based on visual stimuli.

11 Q. Okay. Thank you.

12 Is that -- what's the next one?

13 A. The next one is under CVLT-C, further down  
14 the page.

15 Neuropsychologists, again, just to  
16 clarify, I'm not attempting to insult your  
17 intelligence, but when you go to the doctor and you  
18 get a complete metabolic panel or a complete blood  
19 count, you get a lab result sheet that has 20  
20 indicators on them and most of them are normal. The  
21 way that a flexible battery works, we test a wide  
22 variety of areas, not necessarily expecting all of  
23 them to be impaired, and so I'm just skipping the ones  
24 that are -- that are not impaired, which is normal in

1 most populations.

2 Under the CVLT-C, the -- the score that  
3 was impaired is the Trial B score, which is in the  
4 second column, the second row. The Z score is minus  
5 2, which is two standard deviations below the mean.  
6 And -- and that is worse than about 95 percent of age  
7 peers. That is described in the report in the third  
8 paragraph under Testing -- under Test Results on the  
9 prior page. It is a test of memory interference.

10 So essentially when -- the format of the  
11 CVLT-C, which, again, stands for California Verbal  
12 Learning Test for Children, the format of the test is  
13 that a child is asked to remember a list of  
14 information, it's presented several times so that they  
15 can learn successively over the trials. There after  
16 that is a distraction test where a different set of  
17 information is provided.

18 Generally speaking, we are able to look at  
19 two things with this. One of them is something that  
20 psychologists call single trial learning, which means  
21 what it sounds like, can you learn information if I  
22 just tell you once. And you can imagine how that  
23 would be important in a variety of settings.

24 The other thing that this potentially

1 indicates is a kind of frontal executive functioning  
2 that we call interference, and so interference means  
3 that you -- in order to pay attention to things, your  
4 brain has structures and functions that allow you to  
5 select whether you need to pay attention, what you  
6 need to pay attention to. If you think about your own  
7 life and if you are having a problem, you are stuck in  
8 a certain sort of thinking path and you need to --  
9 people will say something like, I need to do a reset,  
10 that's a frontal executive kind of function.

11 And in this case, because RPP1 had normal  
12 Trial 1 performance but impaired Trial B performance,  
13 it is this latter type of problem that this  
14 represents, in my opinion.

15 Q. Okay. Thank you.

16 Anything else?

17 A. The scores for the Wisconsin Card Sorting  
18 Test, this is the WCST-64 that's immediately below  
19 that. I apologize. That equal sign in the first line  
20 should be a hyphen. So that's the name of the test.  
21 WCST stand for Wisconsin Card Sorting Test.

22 The -- those scores are right on the edge  
23 of psychometric impairment. If a standard for  
24 psychometric impairment of 1.3 standard deviations is

1     used, then a T score of 37 is considered impaired, but  
2     a -- it is more than one standard deviation below  
3     average and there are multiple variables on that test  
4     that are abnormal or subtly abnormal, and because I  
5     had already seen another kind of executive deficit in  
6     the CVLT-C as described in the report, I did consider  
7     the -- the performance in the Wisconsin Card Sorting  
8     Test as potentially correlating with that earlier  
9     finding.

10           Q.     All right. Anything else?

11           A.     The -- the remainder of the cognitive  
12     testing I read as normal. And I also read the measure  
13     of adaptive functioning, the Vineland, and the measure  
14     of behavior functioning, the BASC, as normal as well.

15           Q.     Okay. Thank you.

16           A.     If I go -- if you bear with me for one  
17     second, I can talk to you about -- sorry. One moment,  
18     please.

19                   The -- the BASC score form that we looked  
20     at for the previous children is on Page 96 of this PDF  
21     file, and if you would like, you can quickly look at  
22     that, but it is normal.

23           Q.     I see. That -- I have this up on the  
24     screen now.

1           A.       And see -- yeah, here you see that,  
2       correct, and so you can see that on the screen that  
3       all of the dots are in the white area and so we  
4       consider this -- this is totally normal.

5           Q.       Okay. Thank you.

6                   Does that complete a description of the  
7       test reports in which you saw some findings that  
8       represented evidence of any deficits or impairments in  
9       R[PPI] V[PPI]

10          A.       Yes.

11          MR. ROGERS: All right. I think we are ready to  
12       move on to D[PPI] W[PPI], so it's about 10:20 or so.  
13       Let's take a five-minute break. And we are making  
14       good progress here. I -- I'm optimistic that we can  
15       finish, you know, around lunchtime depending on the  
16       other attorneys questioning.

17                 So we are making good progress here. We  
18       are moving right along efficiently. Let's take a  
19       five-minute break, please.

20          THE VIDEOGRAPHER: Going off the record,  
21       10:23 a.m.

22                   (WHEREUPON, a recess was had  
23                   from 10:23 to 10:31 a.m.)

24          THE VIDEOGRAPHER: Back on record, 10:31 a.m.

1 (WHEREUPON, a certain document was  
2 marked Mira Krishnan, Ph.D.  
3 Deposition Exhibit No. 19, for  
4 identification, as of 10/06/2020.)

5 BY MR. ROGERS:

6 Q. Okay. Dr. Krishnan, what I have up on the  
7 screen now, I hope you can see it, is Exhibit 19,  
8 which is the full record including your report and all  
9 the underlying test data records for D[PPI] W[PPI].

10 So just to go over the basics here again  
11 like we did before, the date of the evaluation for her  
12 that you did was June 26th, 2020, right?

13 A. Correct.

14 Q. And she, at that time, was 11 years and 1  
15 month old -- or sorry -- 10 years -- 11 years and 10  
16 months old, right?

17 A. Correct.

18 Q. And she had just finished the sixth grade,  
19 right?

20 A. Correct.

21 Q. In terms of the information that you had  
22 about her blood lead levels, I want to show you this  
23 first one.

24 Okay. The ones that you had in your

1 records, the first one that you had was reported here  
2 on Page 2 on March 28th, 2016, she had a negative  
3 blood lead study because it was less than the  
4 3.3 micrograms per deciliter, right?

5 A. Correct.

6 Q. And then on the --

7 A. There is another one that's in that same  
8 paragraph. The -- the date is not right next to it,  
9 but on 7/5 -- 15/16 she saw her primary care physician  
10 and she had, based on my understanding of the records,  
11 a venous blood lab on the same day and that's that  
12 0.6 micrograms per deciliter.

13 Q. Thank you. That is the one that I was  
14 looking for. So the other one is -- was measured at  
15 .6.

16 And just not to belabor the point, but  
17 with respect to DPPI [REDACTED] WPPI, similar to the other  
18 plaintiffs, you haven't compared these -- or this  
19 report of .6 to the average of kids her age at that  
20 time nationally, right?

21 A. Correct.

22 Q. Now, you did mention in your report that  
23 you had seen from the deposition transcript that there  
24 was a -- another blood lead level measurement that --

1 for D[PPI] W[PPI] from September 25th, 2009, that was  
2 measured at 2 micrograms per deciliter when she would  
3 have been one year old.

4 Do you recall that?

5 A. Yes.

6 Q. Did you actually see that blood test  
7 report in -- in your records that you reviewed?

8 A. No. That -- that's the reason it's only  
9 described in the Deposition Review.

10 Q. Okay. Let me see if I can find that for  
11 you so that we can show that to you.

12 Okay. Can you see what I have up on the  
13 screen now?

14 A. Yes, I can.

15 Q. So here is the record that I believe was  
16 marked in -- as an exhibit in the -- in the deposition  
17 that you described in the -- the -- your report. You  
18 can see that it's for the play -- patient D[PPI]  
19 W[PPI], date of birth [PPI] 2008.

20 It's for a sample received September 25th,  
21 date collected, 2009, and it has a recording here:  
22 "Lead interpretation: Blood lead in children,  
23 9/25/09."

24 And here is the number right over here,

1 and the reference range you can see is the same as the  
2 other reference ranges, micrograms per deciliter, and  
3 it has got a -- a measurement or a test result of 2.0.

4 Do you see that?

5 A. Yes, I do.

6 Q. Is -- what significance does -- assuming  
7 that it's accurate, what significance does this have  
8 to any of the opinions with respect to her that you --  
9 that you hold?

10 A. So, the -- this lead level is the highest  
11 blood lead level that I am aware of for DPPI. It  
12 was clearly collected long before the -- the Flint  
13 water crisis happened, if it's okay if I call it that.  
14 It occurred before the change in the water system to  
15 the Detroit -- from the Detroit River or back to the  
16 Detroit River.

17 What is challenging with these blood labs  
18 in general is that some of them are -- again, I'm not  
19 a blood -- a cap -- a blood lab expert, I'm not a  
20 phlebotomist or a -- I'm not -- I'm not the  
21 appropriate expert for that, but to the best of my  
22 knowledge, the -- some of these blood labs are  
23 capillary draws and some of them are venous draws.

24 Based on my understanding, the relevance

1 of that is that the capillary draws have a high  
2 threshold for minimal detection. That's the -- I  
3 think that -- I've -- I -- I believe, although I am  
4 not sure, that in the case of all of the labs that are  
5 resulted -- reported as negative, below  
6 3.3 micrograms, that those are probably capillary  
7 draws, whereas, like, in this case this is presumably  
8 a venous draw because the level is only 2 and the --  
9 the other one that we just discussed is presumably  
10 also venous. I -- I think, actually, that one was  
11 reported as venous.

12 The reason I say that is that because it  
13 is plausible that she had high lead level continuously  
14 during this time. I just -- I don't have any  
15 information about her lead exposure or lead levels  
16 between 2009 when she had a positive draw and 2017  
17 when she had the -- or I'm sorry -- 2016 when she had  
18 the next positive draw.

19 Q. Okay. That's interesting. So --

20 A. So that it --

21 Q. Go ahead.

22 A. No, I'm sorry.

23 So, it's hard to make a conclusive  
24 statement about that, but it does certainly raise the

1 possibility that -- that she had some -- I'm sorry,  
2 let me rephrase that.

3 She has evidence of lead exposure prior to  
4 the water crisis.

5 Q. And I think you said just a moment ago,  
6 correct me if I'm wrong, that it's plausible that she  
7 had an elevated lead level from 2009 up until 2016.

8 Did I mishear you?

9 A. It -- it's within the realm of possibility  
10 but I can't comment on whether it's probable or not.

11 MR. ROGERS: Let's mark this as an exhibit.

12 Would this be -- this is going to mess up  
13 my numbering system, Juliana, but so be it. Is this  
14 one now going to be 20 or 19?

15 THE COURT REPORTER: Twenty.

16 MR. ROGERS: Thanks.

17 (WHEREUPON, a certain document was  
18 marked Mira Krishnan, Ph.D.  
19 Deposition Exhibit No. 20, for  
20 identification, as of 10/06/2020.)

21 MR. ROGERS: Okay. That won't mess it up too  
22 much, Juliana, because we only have three more, so  
23 we'll just revise those on the fly here.

24 BY MR. ROGERS:

1 Q. So I brought -- excuse me -- I brought  
2 back up Exhibit 19, which is the full record for  
3 D[PPI] W[PPI], where we had highlighted those blood  
4 lead levels that you can see on Page 2 of the report.

5 So I want to do what we did with the other  
6 plaintiffs, we'll go to your Diagnostic section, which  
7 is at the end of your report here on Page 9 in this  
8 case.

9 Without, you know, having to go off --  
10 over this all again like we did before, but just see  
11 if we can move through this efficiently, your -- your  
12 diagnosis based on your evaluation and your -- the  
13 history that you took, et cetera, et cetera, for  
14 D[PPI] W[PPI] is: "...mild neurocognitive  
15 disorder...which is more likely than not a result of  
16 developmental lead exposure," correct?

17 A. Correct.

18 Q. And is it also true that in thinking about  
19 it some more, as you did with the other two plaintiffs  
20 whom you diagnosed with this condition, that you  
21 believe it's more -- a more appropriate diagnosis at  
22 least using the DSM criteria would be for the Other  
23 Unspecified Neurodevelopmental Disorder?

24 A. So, the -- my answer is the same, but as I

1 have said previously, I believe that if the DSM-V is  
2 used as a strict source of criteria, then the  
3 condition is somewhere in between this and the DSM  
4 Unspecified Neur- -- the Neurodevelopmental Disorder  
5 that we previously discussed.

6 Q. Okay. Now, you know, D[PPI] is older  
7 than R[PPI] right, and she -- she was quite a bit  
8 younger. D[PPI] when you saw her was almost 12, I  
9 guess.

10 Do you have an opinion as to whether or  
11 not there is evidence of a decline in D[PPI] W[PPI]  
12 cognitive performance in any particular areas, or is  
13 it that what you -- your opinion is that the -- she  
14 simply has deficits but you can't specify as to  
15 whether there has been a decline from a previous  
16 functioning level or not?

17 A. I do not believe that I can make a  
18 quantitative statement about that. In -- in  
19 D[PPI] case, there is more detailed school record  
20 information than there were for some of the other  
21 bellwethers, but in my review of that school  
22 information, the pattern is inconsistent from report  
23 to report, and so I do not think that that is clear  
24 enough to be able to infer declines in functioning.

1 And I'm not aware of any prior neuropsychological  
2 testing.

3 Q. Right. Okay. Let -- let's just be clear  
4 about that too.

5 In -- in any of the education records that  
6 you've seen, I think I'm correct that -- and -- and  
7 tell me if this is right -- that there were no  
8 neurological psych -- psych -- sorrow -- sorry, let me  
9 restart -- no neuropsychological testing of the  
10 batteries of tests that you performed on these  
11 plaintiffs had been done in any of the records that  
12 you've seen before, right?

13 A. With respect to the four bellwethers that  
14 we are currently discussing, that's correct.

15 Q. Right. Okay.

16 So, to the extent that you saw  
17 inconsistencies or reports in the education records,  
18 what -- what types of -- with DPPI [REDACTED], that is, what  
19 types of reports are you referring to in terms of  
20 these inconsistencies that you've described?

21 A. That is in -- on Page 2 of my report at  
22 the bottom, the full paragraph -- the paragraph that  
23 begins at the -- about halfway through the page and  
24 then continues to the top of Page 3.

1                   During this time period there were  
2   generally satisfactory ratings for DPPI up until  
3   around 2016. After 2016 she was noted to, I'm quoting  
4   myself: Have fair to poor citizenship, needing  
5   supervision, disregarding suggestions and being  
6   frequently disruptive. She had a decrement in grades  
7   at that time. In 2017 and '18 similar reports were  
8   made by the school, although not in every marking  
9   period. And she had a non-proficient language score  
10   in the M-Step in 2018, I believe, and -- and then in  
11   2018 to 2019, similar issues were noted that were not  
12   noted in prior notes from the school.

13           Q.     I see.

14                   On Page 3 of 9 of the -- of your report  
15   there is a reference to her having been disruptive  
16   during MAP, M-A-P, testing, and then you note  
17   parenthetically that: "(As an aside, I did not  
18   receive that MAP testing to review.)"

19                   What did you mean -- what's MAP testing  
20   and why did you make that statement?

21           A.     MAP, M-Step and NWEA are various  
22   standardized -- more or less standardized assessment  
23   tools for -- that schools use. I'm not a teacher and  
24   I'm not an expert in these particular tools, but they

1 produce psychometric scores, typically including  
2 things like percentile scores in academics that are  
3 reasonably comparable to the percentile scores in  
4 academic tests that I use like WRAT5.

5 Q. I see.

6 So, having noticed that in your report --

7 MR. ROGERS: Patrick or Louise or Corey, is  
8 there some reason why that hasn't been received from  
9 the school or is there a way that we can get that,  
10 what -- what's the story on that, does anyone know?

11 MS. CARO: I'm not sure. I'll have to get with  
12 Corey and Patrick to find out, unless they have an  
13 answer for you now.

14 MR. ROGERS: Yeah, okay. Let's do that. And  
15 I'll -- I -- I had offered to make sure that I'll  
16 circulate a list of a couple of additional things that  
17 we are looking for, so let -- that will be on the list  
18 because we don't have that testing either, so let's  
19 see if we can get that.

20 BY MR. ROGERS:

21 Q. Okay. Thanks for that, Doctor.

22 The -- would you explain -- and, again, I  
23 know it's in your report, but explain to me the basis  
24 for your diagnotice -- diagnosis of DPPI [REDACTED] WPPI as

1   having a mild neurocognitive disorder or sort of a  
2   blend of that and in between other unspecified  
3   neurodevelopmental disorder?

4           A.     So, the easiest way to do that would be to  
5   look at the test results, as -- as you requested for  
6   the previous bellwethers. Excuse me. So I found  
7   impairments in visual and spatial processing with a  
8   significant discrepancy between verbal and fluid  
9   reasoning skills. And so if you want to look at the  
10  scores, which we have done previously, the WISC-V, if  
11  you look at the -- the third line below that for fluid  
12  reasoning, here the Matrix Reasoning and Figure  
13  Weights are both measures of -- of fluid reasoning or  
14  visual reasoning, and they are both impaired.

15                If I use the staid -- same standard of  
16  impairment of 1.3 standard deviations below the mean  
17  in the measurement metric that's used for IQs, that's  
18  a measurement of 80 or low -- or lower. And so the  
19  FRI, which is in the line that's marked Indices, which  
20  is 74, that index is composed of those two fluid  
21  reasoning measures, and so you see that that is also  
22  impaired.

23                Moreover, you -- as a -- as -- as  
24  described above in the report, there is a large

1 discrepancy between the verbal reasoning and the fluid  
2 reasoning. Quantitatively that is the difference  
3 between that VCI score of 100, which is composed of  
4 the first two tests in the verbal -- or the -- the --  
5 the line marked "verbal" and the FRI, which is the  
6 Fluid Reasoning Index. Sorry. VCI stands for Verbal  
7 Comprehension Index, FRI stands for Fluid Reasoning  
8 Index. And so the difference between those two is  
9 26 points, which is close to two standard deviations  
10 of difference and is relatively rare in the general  
11 population.

12 Q. Okay. And the -- the Full Scale  
13 Intelligent Quotient, FSIQ, that's a 91.

14 Does that put her in the basically 50th  
15 percentile for her age group?

16 A. I would have to look at a percentile  
17 calculator, but it is more like the -- somewhere  
18 around the 30th percentile.

19 Q. Okay.

20 A. But it is considered normal.

21 Q. Yep. Okay. Let's -- let's do that.

22 So I -- I had asked you to -- to explain  
23 the basis for your diagnosis based on your evaluation  
24 and testing, and you were beginning to do that, and

1     you've told me about this first one, the tests for the  
2     WISC-V.

3                     Are there others that you can refer me to  
4     that form part of the basis for that opinion?

5             A.     So, I looked at frontal and executive  
6     functioning -- functioning in detail and there were  
7     impaired scores in some of those tests as well. If  
8     you look at TMT, that test that we've discussed a few  
9     times now, this test was also, again, impaired in  
10    DPPI -- in DPPI .

11                    The difference between her impairment and  
12    the impairment to the other children, there are two  
13    noticeable differences. So this is a test that --  
14    that the A component of this test is a visual scanning  
15    and rapid sequencing test. It is very easy for  
16    children of this age, and so they complete it very,  
17    very quickly. So although the -- the raw score of  
18    37 seconds is fairly similar to what was seen in some  
19    of the younger children, it is much worse at  
20    DPPI age. It was almost three standard  
21    deviations below the mean, which is -- is a -- a very  
22    unlikely score in the general population.

23                    The B index, which we haven't discussed in  
24    this deposition, the difference between A and B is

1     that the B component involves something that  
2     psychologists call dual tasking or set shifting. It  
3     involves essentially requiring children to maintain  
4     two flows of information at the same time and switch  
5     back and forth between them in order to correctly  
6     solve the problem, and that was also impaired. That's  
7     that Z score of minus 1.7.

8             In addition to that, the other area where  
9     the impairment was seen was the Tower of London, which  
10    is further down the page, TOL-DX. And there the --  
11    this is a test of multistep problem solving. So what  
12    a child has to do is solve a problem that gets  
13    increasingly more difficult, that requires them to  
14    think multiple steps in advance. So if they don't  
15    think multiple steps in advance, they do something  
16    that looks like it might solve the problem but it  
17    actually makes the situation worse, if you can imagine  
18    that, and that's the kind of test that this is.

19            And I am -- I -- I have this up on my  
20    computer as we did yesterday, but on the previous  
21    page, Page 6, I describe this in text, but what  
22    happened is that when these problems were relatively  
23    easy, and easy in this case was five steps, she did  
24    very well. She became more inefficient and then she

1     also broke the test rules later in the test when it  
2     became more challenging. That's that RVS score of 72  
3     which is psychometrically impaired. It was actually,  
4     I think, I'd have to look at the test form, but I  
5     think it was actually only one error, but those errors  
6     are uncommon enough in children this age, especially  
7     once they've learned the rules and made it halfway  
8     through the test that I consider that remarkable and  
9     it -- it is psychometrically impaired as well.

10                 So, to summarize, she showed problems with  
11     visual reasoning as well as problems with rapid  
12     information processing, divided attention, or set  
13     shifting, and -- and also with flexibility in problem  
14     solving.

15                 Q.     Show me where that is, please.

16                 A.     The flexibility and problem solving is  
17     a -- the Tower of London.

18                 Q.     Oh, okay.

19                 A.     Sorry. I -- I think I used a different  
20     term, but that -- that's a general kind of category  
21     that we would put this in.

22                 Q.     I don't see that on the report in scores  
23     on this summary sheet here.

24                         Is that -- am I missing that?

1           A.       I'm sorry. The -- the -- the -- this  
2       Tower of London, TOL-DX is the one that you just  
3       circled with your cursor.

4           Q.       Yeah, but you said -- I don't see the  
5       reference to the problem solving issues that you just  
6       described.

7                    What -- which of these numerical scores  
8       represent that?

9           A.       RVS of 72, that's the second row, first  
10       column.

11          Q.       All right. Thank you.

12                    Okay. Continue on. Is there any other  
13       evidence in the testing as to her -- relevant to her  
14       diagnosis that you made?

15          A.       Those were the -- excuse me -- only  
16       cognitive deficits. I -- I rated -- I considered the  
17       Vineland Adaptive Behavior Scale to be normal in her  
18       case, and then, again, there is a description of the  
19       BASC in the report, and then I will give you the page  
20       number for the detailed score sheet for that, and that  
21       is -- oops -- 98 in this case.

22          Q.       Yep.

23          A.       And so here the Atypicality Index is one  
24       that we haven't talked about before. That is the one

1 that is in the dark gray area. It is at the  
2 95 percentile, meaning that only one out of 20  
3 children this age have as many behaviors in this area.  
4 Atypical behaviors are strange -- essentially, I  
5 apologize for the use of non very -- not very  
6 psychological language, but they are strange or weird  
7 behaviors, children who do things that seem odd or off  
8 to their parents or other people. That one was the  
9 most elevated in APPI [REDACTED] case.

10 And then there were some milder elevations  
11 with a lack of social el -- engagement, attention  
12 problems and adaptability.

13 Q. What were the weird behaviors that the  
14 parents described? Would we have to look at the --  
15 their -- their answers to that?

16 A. One moment, please.

17 MR. ROGERS: Hey, Corey, if you wouldn't mind,  
18 can you go on mute. I think I'm hearing some  
19 fuzziness sound coming from your phone.

20 MR. STERN: I'm on mute.

21 MR. ROGERS: Oh, okay.

22 THE WITNESS: I'm not sure who that is. I hear  
23 it also.

24 MR. ROGERS: Yeah.

1 THE WITNESS: I don't think it is me because  
2 it's quiet here.

3 MR. ROGERS: Yeah, my -- it's quiet here too.

4 BY THE WITNESS:

5 A. The -- the items with my concern that --  
6 that I do what I am supposed to to protect test  
7 security, meaning that we generally -- these kinds of  
8 tests work better if the general public don't know  
9 about the content of these, but those items are in the  
10 documents that we have provided to you and they are on  
11 Page 117 and 118.

12 And so in her case, these were things like  
13 acting confuse -- confused, having staring spells, and  
14 then there was a wide variety of things like saying  
15 things that don't make any sense or being unaware of  
16 others that were marked as sometimes --

17 It's a -- it's up from here. It is on a  
18 prior page.

19 BY MR. ROGERS:

20 Q. Oh, I see. Okay.

21 A. It is right there, yeah.

22 Q. Yeah.

23 A. I also describe this in the interview,  
24 sorry to make you flip around through a very large

1 document, but on Page 4 of the report, which is also  
2 Page 4 of the PDF file, I --

3 Q. Can I -- I'm sorry --

4 A. I noted in the --

5 Q. Sorry, Doctor. Just let me stop you for  
6 now. I'm still looking at this one here. Give --  
7 bear with me a minute.

8 A. Please.

9 Q. So the -- the -- I asked you the question,  
10 you know, what -- what did the parents describe as her  
11 behavior that was weird, as you -- the word you used,  
12 and then so it's under this Atypicality section on the  
13 bottom of Page 117 and then down to 171, right? Okay.

14 A. Down to -- yeah, yes, correct.

15 Q. Yeah, the next page?

16 A. Those two pages.

17 Q. Item -- Item 171.

18 And, you know, you made a comment about  
19 not disclosing -- disclosing these -- this information  
20 to the general public. I -- I hope you've been  
21 informed or that you're -- you're aware, I didn't mark  
22 this court order, but there is a court order in the  
23 case that called for production of this material that  
24 allowed you to produce it after consultation with the

1 judge and the attorneys, it was an agreed upon order,  
2 that the information is confidential under the court's  
3 protective order and it's to be used only by the  
4 neuropsychologist consultants in the case or other  
5 medical professionals, as well as the lawyers would  
6 have to have access to it for, you know, use in the  
7 litigation and the evaluation.

8           So, something to the effect you said, you  
9 know, they are not -- it is not supposed to go to the  
10 general public, it isn't, you know. You understand  
11 that, right?

12           A.     That's the reason I produced the  
13 information to you, yes.

14           Q.     Exactly, okay. So you were just  
15 explaining something about, you know, this information  
16 generally as to why it's not disclosed, but you  
17 understand it's not being disclosed in this case  
18 except for as purposes that are allowed under the  
19 court order.

20           Okay. So, that -- did -- did you want to  
21 direct me to, what was it, Page 4 of your report for  
22 her to describe this?

23           A.     Yes, please.

24           Q.     Yeah.

1           A.       So, the -- the correlating things that the  
2       parents reported on Page 4 are primarily in the  
3       paragraph that says: "They started noticing," it's  
4       the bottom paragraph on the screen, where you are  
5       currently.

6                       There they noted that she is foggy, she  
7       will have unusual lack of detail in things that she  
8       explains. Those are the things that she was noted to  
9       have that fit with Atap -- Atypicality Index that came  
10      up in the interview. They did also mention things  
11      that fit with some of the other more mildly elevated  
12      index -- indices, and so in the next paragraph  
13      DPPPI mentioned that she -- she said, I don't let  
14      people get too close to me. For what it's worth in my  
15      experience, that's an unusual statement by an  
16      11-year-old.

17           Q.       Okay.

18           A.       But it correlates with the Social  
19      Withdrawal Scale on the BASC.

20           Q.       Okay. Thank you.

21                       Anything else on that?

22           A.       I don't think so.

23           Q.       Does that complete a description of the  
24      evidence that you found in your tests and evaluations

1 that form the basis for your diagnosis of her?

2 A. Yes, it does.

3 Q. I want to turn to the Recommendation  
4 section then, like we did with the others.

5 I was curious, too, why did you call them  
6 recommendations versus, you know, prognosis? Some of  
7 them seem to be, you know, sort of prognosis type  
8 things as opposed to recommendations? Why do you  
9 entitle this section Recommendations?

10 A. I could -- I think that's good advice.  
11 Perhaps I will do that in the future.

12 Typically the -- in my clinical reports,  
13 that's what this section is called. So like in the  
14 template documents that I use, the -- when I change it  
15 in a medical-legal kind of setting, typically I change  
16 it to questions for the examiner.

17 If I was given explicit questions to  
18 answer in a -- oftentimes in these kind of evaluations  
19 there is a list of questions that an attorney provides  
20 and I put them in the report verbatim and then I  
21 answer them one by one. Because that wasn't done in  
22 this case, I used what I usually use in my clinical  
23 reports.

24 Q. Let's see.

1                   For the first recommendation here, you  
2   say: "There is not a clear basis for her to need a  
3   current individualized education plan, but she should  
4   receive accommodations to complete testing in a  
5   private environment as part of a 504 plan."

6                   Do you know if that -- or up until the  
7   point in time that you examined her, she didn't have  
8   an IEP and she didn't have that component of a 504  
9   plan as far as you knew or know?

10           A.     I -- let me review my -- my notes, my  
11   report.

12                   I am not aware that she has had either an  
13   IEP or a 504 plan.

14           Q.     So in terms of accommodations for testing  
15   in a private environment, what does that mean? Does  
16   that mean, you know, testing, if she does academic  
17   tests in school, to have her be separate from others  
18   when she does that?

19                   Is that what that means?

20           A.     Correct. And so typically this -- the  
21   students with attention problems were -- the kinds  
22   of -- the kinds of issues that I described in the  
23   cognitive profile are offered the opportunity to take  
24   tests in something like a resource room or a library

1     that's a low stimulation environment that doesn't have  
2     as many distractions.

3           Q.     Okay. And then turning to the second  
4     paragraph, this -- this one, you know, the language  
5     that you use here, I think you would admit, is a  
6     little bit different than the sections that address  
7     these same subject matters in the -- in the prior  
8     children because you talk about, you know, her  
9     intellectual ability and the -- her FSIQ, but then you  
10    say on the other hand it doesn't match exactly ADHD,  
11    but they -- you talk about the ADHD statistics that we  
12    talked about in that Fredriksen paper.

13                So, when you come to the conclusion here  
14    where you say that there is an increasing risk of her  
15    dropping out of high school to 15 percent from  
16    5 percent versus the general population.

17                Explain to me how it is that you come to  
18    that conclusion for her.

19           A.     So, in her case that is my estimation  
20    based on my opinion that the -- although I did not  
21    diagnose ADHD, that the -- the cognitive symptoms are  
22    substantially similar to ADHD and so I believe that  
23    the rate would be similar to the -- the threefold odds  
24    ratio that we discussed in the ADHD context yesterday.

1 That's from the reference that we discussed yesterday.

2 Q. Right.

3 A. That's provided here.

4 Q. So -- yes. Thank you.

5 So the -- the Fredriksen, Dahl paper, that  
6 is the only scientific literature or paper that you  
7 have cited to or referenced that provides the basis  
8 for your opinion about this increased risk that she  
9 would drop out of high school, is that correct?

10 A. That's correct.

11 Q. Okay. Then we -- you go on to say: "This  
12 is true even though, in a clinical sense, symptoms are  
13 'mild.'"

14 Why did you add that last sentence in  
15 there, what did you mean by that?

16 A. Well, I think that yesterday we discussed  
17 this issue that -- that clinicians use terms like  
18 "mild." Typically we use these terms relative to the  
19 disorder itself, and so sometimes the term "mild," you  
20 know, in my experience is misunderstood by people  
21 outside of the profession.

22 If I use an example that is maybe more  
23 accessible, unrelated to these children, clinicians  
24 have a diag -- have a diagnostic criteria and use the

1 term "mild" to refer to mild Alzheimer's disease, but  
2 nobody wants to have Alzheimer's disease and even mild  
3 Alzheimer's disease is very disabling.

4 And so my point is that although these --  
5 these cognitive symptoms are mild, they are  
6 significant in a real world sense. That -- that's all  
7 I mean by that.

8 Q. Okay.

9 A. The other difference -- the other thing  
10 that you had mentioned earlier and -- and that is in  
11 my report is that differentiates D<sup>PPI</sup> situation  
12 from the other children is that she had this FRI,  
13 Fluid Reasoning Index on the WISC that was in the --  
14 that was impaired, the score was 74 or more than about  
15 1-1/2 standard deviations below average.

16 The reason I mention that is because that  
17 was -- in these four bellwethers, I believe this is  
18 the only time when that happened. The significance of  
19 that is that, based on my clinical experience, IQ  
20 scores -- well, let me back up a step.

21 IQ scores have a long history of  
22 predictive validity in a variety of settings, although  
23 I think that they are commonly misunderstood by the  
24 general public. And so I'm saying this not so much

1 for your benefit, but anybody who reads this  
2 deposition, because I think that you probably already  
3 know these things.

4 So people often in the general public will  
5 talk about very high IQ scores, like my IQ is 186 or a  
6 hundred -- 204. When you actually look at these  
7 tests, they often don't even go that high. It's not  
8 possible on this particular test to have an IQ of 200.

9 They also misunderstand and say that, you  
10 know, if -- it's common in -- in general pol --  
11 parlance to make the assumption that people who have  
12 advanced degrees, like yourself or me, have very high  
13 IQs. We might and some of us certainly do, but the  
14 idea that every doctor has an IQ of 130, you know, or  
15 every attorney has an IQ of 130 is -- is not likely to  
16 be true.

17 With that being said, in general, if the  
18 Fluid Reasoning Index is an index of general thinking  
19 abilities, that score is lower in D PPI [REDACTED] case than  
20 IQ scores that are generally considered competitive in  
21 collegiate settings. And so that is something that is  
22 unique for her that didn't come up in the other three  
23 bellwethers that we've been discussing because I  
24 didn't have that kind of finding.

1           Q.     So with respect to the assessment that you  
2     have about collegiate success for D[PPI], you have  
3     an estimate of a likely 25 to 50 percent chance of her  
4     dropping out in secondary education.

5                     Is that percentage estimate also based on  
6     the -- as it was with the others, based on your  
7     anecdotal experience with patients that you've  
8     treated?

9           A.     Yes, it is.

10          Q.     And just to confirm then, there is no  
11     other scientific literature or studies or data that  
12     you can point to that would quantify that for persons  
13     who have the deficits that D[PPI] has?

14          A.     I am not aware of any.

15          Q.     Is that also true -- would that be the  
16     same answer with respect to your statements here that  
17     this results in an overall increased risk that  
18     D[PPI] will work below her potential, that she would  
19     not succeed in a skilled vocation, and would be sort  
20     of relegated to simple unskilled work?

21          A.     Correct.

22          Q.     With respect to these deficits that you've  
23     identified for D[PPI] W[PPI], are their treatment or  
24     coping mechanisms or -- or skills, skill-type training

1 that could help to assist her in overcoming these  
2 deficits, like we talked about with the other  
3 children?

4 A. In D PPI [REDACTED] case, because she shows a  
5 mixture of some of these nonverbal learning problems  
6 and issues that look a little bit like ADHD but not  
7 very clearly like ADHD, but that are psycho -- that do  
8 correlate with psychometric impairments and attention  
9 functions, it would be a mixture of the two.

10 The -- I'm sorry. It would be a mixture  
11 of some of the things that we talked about earlier.  
12 For her visual reasoning, increased exposure to art,  
13 like drawing or painting would be very helpful,  
14 occupational therapy might also be helpful. And then  
15 for her attention problems -- I'm sorry. And for --  
16 for her visual problems, so far I don't see a basis  
17 for her needing an IEP on that basis, and I'm not sure  
18 that she would, but the accommodative approaches like  
19 the 504 plan would probably be sufficient to mitigate  
20 that.

21 With respect to her attention, it would be  
22 reasonable for her to see a psychiatrist. It's  
23 possible that medications would -- would be beneficial  
24 for that as well.

1           Q.     Would you expect those types of treatments  
2     or accommodations that -- or skill set learning that  
3     you describe to be successful?

4           A.     I -- it depends, I think, on how you  
5     define successful. What I could say is that when it  
6     comes to IQ scores, there is no good evidence that IQ  
7     scores can be -- that -- that the -- let me -- let me  
8     rephrase that.

9                     There is no good evidence that the  
10    underlying cognitive abilities that I -- IQ scores  
11    measure can be meaningfully changed by interventions,  
12    and so that FRI, for instance, being in an impaired  
13    score would be unlikely to change from interventions,  
14    but it may be that -- that through a mixture of  
15    learning, learning techniques and compensatory tools,  
16    and possibly emphasizing work that can be done in a  
17    way that does not highly leverage those kinds of  
18    skills, that -- that somebody like DPPI [REDACTED] could  
19    mitigate.

20          Q.     All right. Since you are of the opinion  
21    that these deficits that she has experienced were  
22    caused by developmental lead exposure, if going  
23    forward she doesn't have any additional exposure to  
24    lead, would these symptoms and deficits diminish over

1 time?

2 A. In general my answer to that question is  
3 the same as before. The only difference I would offer  
4 is, as you noted, D PPI is one of the oldest  
5 bellwethers -- I think she is the oldest of these four  
6 bellwethers. I think that, if I remember correctly,  
7 she is also either the oldest or close to the oldest  
8 of the 14 children that I evaluated.

9 The only caveat I would really offer is  
10 that in D PPI case I am not the expert on bone  
11 lead measurement and -- and I -- I believe that there  
12 may be others who will testify in more detail about  
13 that, but D PPI was 11 already, almost 12 when she  
14 had her bone lead measurement. And in general what I  
15 would say is that the -- the amelioration possibility  
16 that arises from the cessation of lead exposure is  
17 going to be higher when the lead exposure period is  
18 briefer and when there is more time during the  
19 developmental period to recover.

20 Q. What is that based on? Where do you  
21 derive that information?

22 A. That's based on my general understanding  
23 of brain development.

24 Q. Okay. Can you see what's up on the screen

1 now? This is -- this is the summary sheet, initial  
2 summary sheet page for her testing, D[PPI] W[PPI], and  
3 I -- can you see that all right?

4 A. I can, yes.

5 Q. Each of these sheets, and I didn't ask you  
6 about all of them, but I -- I think I asked you about  
7 one, and I just want to clarify here, where it says:  
8 "Hours of neuro" -- "neuropsychologist face-to-face,"  
9 in this case you have it as 9 to 12:15, does that  
10 include the time for the interviews with the parents  
11 and the testing, or parent?

12 A. I believe in this case that that's the  
13 testing.

14 Q. All right. Is -- would that be true with  
15 each of them, that is to say, this period of time that  
16 you recorded there would only be the actual  
17 face-to-face with you when the testing was being done?

18 A. I believe that's correct. Generally  
19 speaking the testing component for each of these  
20 children took about three hours.

21 Q. All right. And what -- what would you say  
22 the approximated time was that you spent with the  
23 parents doing the interviews and getting the history  
24 and that sort of thing?

1           A.     I believe in general most of the  
2 interviews were about an hour long.

3           Q.     And then you say over here: "Hours  
4 interpretation," I can't read your -- read your  
5 handwriting here.

6                     What does that say?

7           A.     I -- I may not have even finished writing  
8 that. These are just notes that I was taking during  
9 the evaluation, but it says that I spent an hour  
10 reviewing records before I saw D[REDACTED].

11          Q.     Well, what -- read to me what these  
12 notes -- what the words are or the numbers that you  
13 have written here. I can't make them out.

14          A.     It says: "Plus one pre, plus one lunch  
15 hour."

16          Q.     Okay. So for these sections of the  
17 reports under "hours interpretation," your notations  
18 there would mean the amount of time that you spent  
19 reviewing the records and then, either before the  
20 interview or after, and then additional time, if you  
21 did spend it, on interpretation of the test results,  
22 is that right?

23          A.     I apologize. It's -- so this is not a  
24 complete accounting of the time that I spent on this

1 report. I -- I did not finish writing this report  
2 over lunch after I saw her, but -- but these are times  
3 that I spent interpreting. So what this means in this  
4 case is that I spent the lunch hour scoring tests.

5 Q. Right. Okay. I get it. So you had told  
6 me that before, if -- if there is any time in these  
7 summary sheets under "hours of interpretation," that  
8 does not include the time that you spent actually  
9 writing up the reports.

10 You did that later, right?

11 A. Correct.

12 Q. Okay.

13 I want to ask you some questions about --  
14 and I think this will now be a paper that we're going  
15 to mark as Exhibit 21, just to make sure.

16 MR. ROGERS: Is that -- are we right on that,  
17 Juliana, this would be 21?

18 THE COURT REPORTER: Yes.

19 (WHEREUPON, a certain document was  
20 marked Mira Krishnan, Ph.D.  
21 Deposition Exhibit No. 21, for  
22 identification, as of 10/06/2020.)

23 BY MR. ROGERS:

24 Q. Do you recognize this Ko -- paper, Doctor,

1 from the lead author Karin Koller, I believe it's  
2 mentioned or listed in the Bibliography of references  
3 that you prepared for your report, is that right?

4 A. Yes, I -- I believe that I have read this  
5 paper.

6 Q. So you're -- you're fam --

7 A. I think this is one that I cited.

8 Q. Yeah. I don't recall that you -- correct  
9 me if I'm wrong -- I don't recall that you referred to  
10 or cited this paper for any specific parts of your  
11 report or any of your diagnoses or conclusions.

12 Am I right on that?

13 A. I believe that -- it may be that I cited  
14 it explicitly in another one of the -- the reports  
15 from the 14 children that I saw.

16 Q. I see.

17 With respect to these bellwether  
18 plaintiffs, nevertheless, this was one of the papers  
19 that for these four you included in your overall  
20 Bibliography, right?

21 A. That's correct.

22 Q. Okay. And this -- this study says in the  
23 abstract, I guess that's what you would call this.

24 What would you call this first section

1 here highlighted in blue? Is that the abstract or  
2 basically the summary of the article?

3 A. That's the abstract, you are correct.

4 Q. Okay. Thank you.

5 It says here -- and this is a paper from  
6 2002, I believe -- I'm sorry, 2004.

7 And it says: "In the last decade  
8 children's blood lead levels have fallen significantly  
9 in a number of countries, and current mean levels in  
10 developed countries are in the region of 3 micrograms  
11 per deciliter."

12 Do you have any reason to disagree with  
13 the author's statement as to the current mean levels  
14 in developed countries for blood lead levels?

15 A. If I recall correctly, you showed me CDC  
16 data -- you showed me CDC data yesterday and when you  
17 were asking me if I had considered normative bases for  
18 lead levels, and the data that I recall you showing me  
19 was more like 0.6 micrograms per deciliter as a mean  
20 level.

21 Q. Right. But those were in late -- right,  
22 but as you recall, those were in later years. This --  
23 this study is reporting on, you know, data prior to  
24 2004. That information that I showed you yesterday

1 was based upon data sampling that began in 2011  
2 through 2016. So what I'm asking you is that do you  
3 have any reason to disagree with the author's  
4 statements about the mean blood lead levels that they  
5 are reporting as of 2004?

6 A. No.

7 Q. Then the authors go on to state in the  
8 abstract here:

9 "However, from a public health  
10 perspective, exposure to lead should be seen within  
11 the many other risk factors impacting on normal  
12 childhood development, in particular the influence of  
13 the learning environment itself. Current lead  
14 exposure accounts for a very small amount of variance  
15 in cognitive ability (1 to 4%), whereas social and  
16 parenting factors account for 40% or more."

17 You're familiar with the author's  
18 conclusion as it's expressed here?

19 A. Yes.

20 Q. Do you have any reason to disagree with  
21 it?

22 A. In the context that the authors are  
23 speaking in, no.

24 Q. What do you mean by that, what context?

1           A.       This is a cross-sectional -- these --  
2       these -- this is based on cross-sectional data about  
3       large populations in which there is much more  
4       variability in factors like social and parenting  
5       factors than there is in factors like lead.

6                       So, the authors, to the best of my  
7       understanding -- and I didn't write this paper -- but  
8       the authors, to the best of my understanding, are  
9       saying that when you look at the general population,  
10      lead is not a driving factor of cognition in the  
11      general population of children who don't have known  
12      lead exposures. But that's not the population that we  
13      are talking about here.

14           Q.       What is your basis for saying that this  
15      study involves the general population and not children  
16      who have had lead exposure?

17           A.       So, I would be happy to run through this  
18      article in more detail if you want me to take a break  
19      to do that, but it looks like they are using NHANES  
20      data again.

21           Q.       Well, I'm not following, because if -- if,  
22      in fact, as we looked at the statistics yesterday, the  
23      blood lead levels for these four bellwether plaintiffs  
24      are within the range, the measured levels are within

1 the range of what has been reported as average, that  
2 would mean they are not exposed to lead more than, you  
3 know, the average across the nation, right?

4 A. That -- that's your statement, not mine.

5 Q. Is it correct?

6 A. Can you say it again, please?

7 Q. Yeah. Remember the data that we looked at  
8 yesterday with the mean blood lead levels for a period  
9 of time for these in this age group of children, 2011  
10 through 2016, right, we just talked about that. And  
11 if the -- if -- if -- if it's true that the average  
12 blood lead levels reported in that document that I  
13 showed you from NHANES data from the CDC, if the  
14 averages for these children, these four bellwethers  
15 are within that range of average, then there -- it  
16 doesn't indicate that they have been exposed to lead  
17 more than the average of kids across the country,  
18 right?

19 A. If the -- if -- if a child has a  
20 lead val -- has lead values that are only within the  
21 average range that are reported in the NHANES data,  
22 then I would agree that that child has a level of lead  
23 exposure that is comparable to the general population  
24 based on that data assuming that there is no other

1 source of information that contradicts it.

2 Q. Okay. So, what is your -- getting back to  
3 the point about this article, I think I would like you  
4 to take the time. Why don't we -- we are very -- we  
5 are on -- we are doing very well on timing, so I would  
6 estimate that I probably only have about another half  
7 hour left, so here is what I suggest.

8 Let's take a -- do you think maybe ten  
9 minutes would be enough for you to just peruse this  
10 article, Doctor, and -- and make yourself familiar  
11 with it so that you can answer that question that I  
12 asked you previously, or how much time would you like,  
13 you tell me?

14 A. I -- I think ten minutes is probably  
15 reasonable. Can you please repeat the question?

16 Q. I hope so.

17 You -- your statement, I think, was  
18 something to the effect of that your understanding of  
19 what the authors were reporting on was an analysis of  
20 a -- of the general population, including a cohort  
21 which had children that were not exposed to high  
22 levels of lead or lead exposure, something to that  
23 effect, and I think you said -- I said what's the  
24 basis for that or you said something about the

1 context, right, and I asked you, Okay, what's your  
2 basis for saying that, and you said, I'd like to have  
3 more time to peruse the article. So I -- I think  
4 that's the thrust of the question.

5 A. Okay.

6 Q. Okay. So I -- I'm looking at --

7 A. So --

8 Q. I'm looking at the basis for your saying  
9 that, you know, what is the context in which the  
10 authors are reporting these findings with respect to,  
11 you know, the lead exposure for the children involved  
12 in the -- in the survey or the study that they did.

13 So let's take -- you know what, we're --  
14 we have plenty of time. It is almost 11:30. Let's  
15 take 15 minutes. I'll give you the time to do that.  
16 And then I'll -- I'll be able to finish up I think my  
17 questioning by, if that's 11:45, I should be done by  
18 12:15 and then I can turn it over to the other  
19 defendants and see how much they have, okay?

20 A. All right. Thank you.

21 THE VIDEOGRAPHER: Off the record, 11:28 a.m.

22 (WHEREUPON, a recess was had  
23 from 11:28 to 11:47 a.m.)

24 THE VIDEOGRAPHER: Back on the record,

1 11:47 a.m.

2 BY MR. ROGERS:

3 Q. Okay. Doctor, we've taken a 15-minute  
4 break, and to turn to the subject, I -- I do -- I do  
5 still have up on the screen, hopefully, this paper we  
6 are referring to, and I think the -- the question  
7 before you was what -- what you wanted to do to put it  
8 in context based on the findings that I reported from  
9 the abstract. So go ahead, please.

10 A. So I just wanted to state for the record  
11 that I -- I didn't write this paper and I'm not an  
12 expert on this paper and you may have to direct some  
13 of the questions that you have to the author of the  
14 actual paper.

15 With respect to this 1 to 4 percent  
16 statement that you had previously discussed and  
17 highlighted, I am not able to determine what the basis  
18 for that statement is. The only place that I see it  
19 made -- referenced, again, in the article is in the  
20 very last sentence where it is a reference to another  
21 paper, and so I'm not sure -- I'm not sure what that  
22 statement -- what the basis for making that statement  
23 is by the authors.

24 Q. Why did you include this -- oh, and just

1 for the record, so I went to that last page of the  
2 article and it -- it says there, as is highlighted:  
3 "Current lead exposure accounts," et cetera, et  
4 cetera, and then it cites to the Weiss paper from  
5 2007, right -- I'm sorry -- 2000.

6 Is that what you meant?

7 A. Yes, correct.

8 Q. Okay. So why did you include this paper  
9 in your Bibliography?

10 A. I don't generally review journal articles  
11 with the expectation that I agree with every sentence  
12 in them or understand the basis for every sentence in  
13 them, but this paper reviewed lead exposure in  
14 children, it discussed a number of studies that had  
15 attempted to determine exposure, it reviewed at least  
16 some findings that children who had lead exposures  
17 below the 10 micrograms per deciliter level that is  
18 typically used to define lead poisoning had decrements  
19 in intellectual funding.

20 Q. Hmm. Okay.

21 Have you ever seen this data, that is,  
22 that: "Current lead exposure accounts for a very  
23 small amount of variance in cognitive ability (1 to  
24 4%), whereas social and parenting factors account for

1     40% or more," have you ever seen that cited by or  
2     referenced by any other authors in your research on  
3     this case?

4             A.     I haven't seen that specific statistic  
5     cited elsewhere.

6             Q.     Have you ever reviewed any studies or  
7     literature from the CDC in which this statement and  
8     these findings are reported and repeated?

9             A.     The -- the highlighted statement?

10            Q.     Yep, the one I just read, yeah.

11            A.     I am not aware -- I am not personally  
12     aware of another source where that statement is made.  
13     I'm -- I'm -- CDC or otherwise.

14            Q.     Okay.

15            A.     If you'd like to show me, I'm happy to  
16     look at it.

17            Q.     No. We can move on at this point.

18                    I'm going to show you another paper. That  
19     one was 21. I'm going to show you a paper now that  
20     will be marked as Exhibit 22.

21                               (WHEREUPON, a certain document was  
22                               marked Mira Krishnan, Ph.D.  
23                               Deposition Exhibit No. 22, for  
24                               identification, as of 10/06/2020.)

1 BY MR. ROGERS:

2 Q. And it's a paper by several authors, but  
3 it's the 2019 Roy and Edwards paper.

4 Do you know who Dr. -- do you see his --  
5 I'm -- my cur -- where my cursor is here, do you know  
6 who Dr. Marc Edwards is?

7 A. That name is familiar. I believe that  
8 I've met Dr. Edwards.

9 Q. Did -- have you had any conversations with  
10 Dr. Edwards about the work that he did analyzing the  
11 water in Flint and the water lead levels and so forth,  
12 the work that he did?

13 A. I -- I have not. If I had met him, it  
14 would have been before this crisis.

15 Q. Okay. Did you --

16 A. I am not sure if I've met him. The name  
17 sounds familiar. There -- but it may also be that  
18 there is a different Marc Edwards.

19 Q. Well, I'm referring -- this Marc Edwards  
20 is the Virginia Tech professor who, you know, came out  
21 and did all of -- all of the water sampling and the  
22 water lead testing for the people of Flint, you know,  
23 after the water crisis had occurred.

24 So is that the person that you believe you

1 met?

2 A. I -- I think, actually, I -- I met a  
3 different Marc Edwards.

4 Q. Oh, okay. Well, so be it.

5 A. My apologies.

6 Q. So -- no, no, that's all right.

7 So, Dr. Edwards has given a deposition in  
8 the case, and just to confirm, this was, I don't know,  
9 maybe a month ago, a few weeks ago.

10 You have not reviewed Dr. Edwards'  
11 deposition testimony in the case, is that right?

12 A. That's correct.

13 Q. In fact, other than the depositions of the  
14 parent plaintiff representatives, you haven't reviewed  
15 any depositions in the case, right?

16 A. I believe that's correct. I believe all  
17 of the depositions I reviewed were of parents.

18 Q. So Dr. Edwards is reporting in this paper,  
19 and he also testified about it in his deposition, that  
20 based on his analysis and the highlighted section that  
21 I have -- have presented to you here, he says:

22 "Although total biosolids lead increased  
23 just 14% during the 18 months of the FWC," meaning the  
24 Flint water crisis, "versus the comparable time

1 pre-FWC, 76 percent of that increase occurred in  
2 July through September of 2014."

3 Do you have any basis or reason to  
4 disagree with that statement by Dr. Edwards?

5 A. I -- I am unable to evaluate that  
6 critically.

7 Q. Is that because you lack the expertise in  
8 that particular field to do so?

9 A. Yes, I don't know very much about biosolid  
10 lead --

11 Q. Okay.

12 A. -- increments.

13 Q. And then he said -- and then he says:

14 "In" -- "And the corresponding percentage  
15 of Flint children under 6 years with elevated blood  
16 lead," and he describes that as greater than or equal  
17 to 5 micrograms per deciliter, "doubling from 3.45% to  
18 6.61% in those same three months versus 2013," and  
19 then he goes on to say here, "was not statistically  
20 higher during the remaining months of the FWC compared  
21 to pre-FWC or post-FWC."

22 Do you see that, up through here?

23 A. I do.

24 Q. Do you have any reason to disagree with

1     that statement?

2           A.     I -- I don't. But, again, I didn't write  
3     this paper and -- and I am -- am just seeing it now.

4           Q.     Okay. I won't go into the rest of the  
5     paper then, but I can -- I'll just try to summarize it  
6     and report to you.

7                     Dr. Edwards reported that there was a  
8     significant spike in lead levels in the biosolids that  
9     he believes indicates a significant spike in the lead  
10    content of the water system during 2011.

11                    Are you familiar with that finding that he  
12    has made at all?

13           A.     I am not.

14           Q.     Have you ever seen any scientific papers  
15    or studies or other references to that that there was  
16    a spike in the lead content of the Flint water in 2011  
17    before the switchover to the Flint River?

18           A.     I -- I am not familiar with that, no.

19           Q.     Okay.

20           MR. ROGERS: Then the last -- this one we marked  
21    as Exhibit -- is this -- would this be 23, Juliana?

22           THE COURT REPORTER: Yes (sic).

23           MR. ROGERS: Thank you very much.

24                     (WHEREUPON, a certain document was

1 marked Mira Krishnan, Ph.D.  
2 Deposition Exhibit No. 23, for  
3 identification, as of 10/06/2020.)

4 BY MR. ROGERS:

5 Q. I want to get to your Notice of  
6 Deposition, which would be No. 20 -- Exhibit No. 24  
7 (sic).

8 So I'm going to ask you some questions,  
9 Dr. Krishnan, just to make sure that you don't have  
10 anything in your files that have -- hasn't been  
11 described or produced yet. This was a -- if you can  
12 see it on the screen, it's what's called the  
13 deposition notice, it sets forth the date when you are  
14 going to be deposed, and it also has a document  
15 request which is called a Schedule A which I'll show  
16 it to you now.

17 I just want to go through --

18 A. You haven't shared your screen yet, sir.

19 Q. Thank you. My bad.

20 There it is. Can you see it now?

21 A. Yes.

22 Q. Okay. So I'll just size it down a little  
23 bit. So as I was saying, this is a Schedule A  
24 document request. There is language in here about

1 the -- producing the file material seven days before  
2 your deposition.

3 But in any event, have you now summarized  
4 for me and/or produced your complete expert file in  
5 the cases involving the bellwether plaintiffs, TPPI,  
6 VPPI, WPPI and -- and SPPI?

7 A. To the best of my knowledge, yes.

8 Q. And you've produced -- Paragraph 2, asks  
9 for the complete time and billing records, you've  
10 provided me with two billing invoices and that's all  
11 you have, right?

12 A. So I -- I provided -- I provided invoices  
13 to the attorneys, and so I am -- the attorneys on the  
14 other side, and so I am not completely sure if there  
15 may have been a -- something missing there.

16 There is an invoice -- sorry. I -- I -- I  
17 didn't submit an invoice that covered the usage of the  
18 retainer for Napoli law until September. That invoice  
19 I provided to -- I had provided it to Napoli. If you  
20 only have the one from Levy Konigsberg, then I believe  
21 the Napoli attorneys are in possession of that and  
22 they can provide that to you.

23 Q. Okay. I think, though, that for -- for  
24 TPPI, VPPI, WPPI and SPPI those are all

1 Corey Stern's clients who would be the Levy Konigsberg  
2 firm, but we can look into that. So thank you for  
3 telling me.

4 You -- you have a separate invoice that  
5 you issued to the Napoli firm for those other  
6 bellwether plaintiffs?

7 A. Correct.

8 Q. But with respect to any work that you've  
9 done on T[PPI], V[PPI], W[PPI] and S[PPI], those  
10 bellwether plaintiffs, you don't have any other  
11 invoices because the reports that you wrote were work  
12 that you did that was included within the billing or  
13 invoicing that you did originally for the case, right,  
14 for these cases?

15 A. That's correct.

16 Q. We have your most current CV, you've told  
17 me that you don't have a testimony list.

18 Is it correct that you don't have any  
19 witness statements, Paragraph 5 here asks for witness  
20 statements obtained by you or reviewed by you in  
21 connection with this case, apart from what's described  
22 in your reports?

23 A. That's correct.

24 Q. The only thing by way of deposition

1 transcripts that you have, Paragraph 6, is the  
2 transcripts -- did you get the exhibits along with the  
3 deposition transcripts for the parent representatives  
4 of these plaintiffs?

5 A. I -- I don't think I did.

6 Q. Did -- there is a typo in this one,  
7 Paragraph 7, but it says: "All facts or data that you  
8 considered in forming your opinions, including, but  
9 not limited to." So let's leave out the "including  
10 but not limited to" because there is nothing after  
11 that.

12 Did you -- have you provided all of the  
13 facts and data that you considered in forming the  
14 opinions that you have in the case concerning these  
15 four bellwether plaintiffs?

16 A. I believe I have.

17 Q. The Federal Rules of Civil Procedure call  
18 for experts to provide information concerning any  
19 assumptions that were provided to experts, and in this  
20 case provided to you and relied upon you in forming  
21 your opinions. I just want to make sure we cover  
22 that.

23 Did you receive any facts that you assumed  
24 to be true from the plaintiffs' lawyers that you

1     relied upon in forming your opinions that you haven't  
2     already told us about?

3           A.     Forgive me for being a little new to these  
4     rules. Can you give me an example of something that  
5     would be -- that would fall in that category?

6           Q.     Sure. I am in an excellent position now  
7     because for the past two days you have been telling me  
8     how any neuropsychologist would know this, and I'm  
9     pleased to be able to explain something to you  
10    concerning the law.

11                   So, that would --

12           A.     The tables have certainly turned on me at  
13    this point.

14           Q.     Yep.

15                   So, the -- an example would be if a lawyer  
16    in an e-mail or a letter, or even in a conversation  
17    said to you, Dr. Krishnan, for purposes of the  
18    opinions that you are going to come up with or  
19    generate in the case, I want you to assume that there  
20    will be evidence that the lead content in the water of  
21    these children was X, and I'm not going to give you  
22    any documents or anything that support that, but I'm  
23    just going to tell you that. I want you to assume  
24    that and have your opinions be based in part on that.

1 That would be an example. So they didn't provide you  
2 with actual data of test reports or something, but  
3 they said I want you to assume that.

4 Is -- is it correct that no such  
5 assumptions -- you have -- you have not asked or been  
6 provided with any assumptions on certain facts that  
7 you relied upon in forming any of your opinions in the  
8 case?

9 A. I don't believe that I have.

10 Q. Have you engaged in any correspondence,  
11 whether e-mail or letters, between you and other  
12 consultants retained for the plaintiffs in the case?

13 A. To the best of my knowledge, only the ones  
14 that I had provided to the law firm to -- to Patrick  
15 Lanciotti in this matter.

16 Q. I think you might have misunderstood.  
17 The -- the -- let me explain. It's not clear.

18 Have you corresponded with any other  
19 expert consultants retained by the plaintiffs in the  
20 case, not with the lawyers but with other expert  
21 consultants?

22 A. I provided Pat -- Mr. Lanciotti copies of  
23 e-mails exchanged between myself and Dr. William  
24 Bithoney.

1 Q. I see. Okay. Thank you.

2 Is there any other such correspondence  
3 with any experts in the case?

4 A. I'm not aware of any.

5 Q. Okay. So whatever correspondence by way  
6 of e-mail that you had with Dr. Bithoney, you still  
7 retain those e-mails and you provided them to  
8 Mr. Lanciotti, is that right?

9 A. That's correct.

10 Q. What subject -- without telling me what's  
11 in the e-mails, what are the basic subject matters of  
12 the correspondence, e-mail correspondence between you  
13 and Dr. Bithoney?

14 A. Most of the e-mails asked me when I would  
15 have reports ready for him to review, and then there  
16 were also, I believe, there was a question about the  
17 date on which I -- the date range in which I had  
18 completed the evaluations. If I remember correctly,  
19 he wanted to know if I had seen the children in May or  
20 June.

21 Q. Okay. Anything else that you can  
22 remember?

23 A. No. Oh, I think --

24 Q. Did --

1           A.     -- I think he also asked me for a  
2     clarification about a demographic factor for one of  
3     the children. I'm sorry.

4           Q.     Was it one of these four?

5           A.     I -- I would have to review those e-mails,  
6     but I -- I think at one point he asked me if one of  
7     the children was a boy or a girl.

8           Q.     Okay. Thanks.

9                     So with respect -- did -- did you have any  
10    communications with Dr. Bithoney that were not  
11    e-mails, that is, telephone conversations, Zoom  
12    conferences or anything like that?

13          A.     He -- if I -- to the best of my memory, he  
14    called me by telephone also on the topic of when I  
15    would have reports available to review.

16          Q.     He really wanted those reports, huh?

17          A.     It is a somewhat long story, but as you  
18    may already know, I -- my involvement in the case  
19    began at a relatively late date and so there were  
20    significant time pressures at that time.

21          Q.     Well, I certainly understand the  
22    sequencing, you know, that's common, right, where  
23    experts sometimes need information and reports from  
24    other experts, so.

1                   Okay. That being said, I want to make  
2    sure, you've never -- you -- before you wrote your  
3    reports, did you -- were you provided with any reports  
4    or information from other consulting experts before  
5    you wrote -- with respect to these four plaintiffs  
6    before you wrote -- you wrote your reports for them?

7           A.     I would like to ask a question of the  
8    attorneys from -- from Napoli and Levy Konigsberg  
9    before I answer that, if that's okay?

10          Q.     Sure.

11          A.     May we go off the record?

12          Q.     Sure.

13          THE VIDEOGRAPHER: Going off the record,  
14    12:06 p.m.

15                               (WHEREUPON, a recess was had  
16                               from 12:06 to 12:15 p.m.)

17          THE VIDEOGRAPHER: Back on record, 12:15 p.m.

18          MR. STERN: This is Corey Stern. Mr. Rogers for  
19    VNA and I just had an off-the-record conversation.

20                   I wanted to note for the record that prior  
21    to Dr. Krishnan agreeing to serve as an expert for the  
22    four bellwether plaintiffs who are the subject of this  
23    deposition, plaintiffs counsel had retained another  
24    expert for the same purpose. Because of the COVID-19

1 pandemic, roughly two to three weeks before that  
2 expert was scheduled to travel to Flint, Michigan to  
3 evaluate the children who are subject of this -- the  
4 subjects of this deposition, that expert informed my  
5 law firm that he was unable to travel or participate  
6 in the litigation in the way in which we had requested  
7 his participation, meaning to physically evaluate and  
8 meet with the children and their families.

9 At that point in time we -- or -- or  
10 somewhere around that point in time we requested an  
11 extension of time from the Court with regard to  
12 provision of expert reports and we hired Dr. Krishnan  
13 to perform the same evaluations and provide her  
14 expertise with regard to those evaluations.

15 Any -- there may have been documents or  
16 communications that were between my office and the  
17 original expert that was retained which we may have  
18 forwarded to Dr. Krishnan before she got started on  
19 her in-person evaluations with the families of --  
20 and -- and the actual plaintiffs for our cases.

21 The -- the original expert did not ever  
22 evaluate the children. He was unable to perform the  
23 tasks that we had asked because of the COVID-19  
24 pandemic and ultimately we are here today for the

1 deposition of the expert that was retained. There was  
2 no reason for that expert to cease working with my  
3 firm other than the pandemic. It is an expert that  
4 I've worked with for close to a decade in lead  
5 poisoning cases who I highly respect and it was  
6 regrettable that he was unable to perform the tasks  
7 that we had hired him to perform.

8                   Notwithstanding that, we are extremely  
9 happy with the work that Dr. Krishnan has done on  
10 behalf of these individual plaintiffs and we are  
11 excited, you know, to have her as part of our -- our  
12 expert team.

13           MR. ROGERS: Okay. Thanks, Corey.

14 BY MR. ROGERS:

15           Q. So, Dr. Krishnan, is it -- is what  
16 Mr. Stern said accurate in the sense that some  
17 information was provided by him to you about some  
18 information or materials that the previous consulting  
19 expert had authored or had input in?

20           A. Yes, it is.

21           Q. And do you have those materials sort of  
22 segregated out or stored or -- or in your files or in  
23 your possession in some form?

24           A. I haven't checked during this break, but

1 if they were provided to me, I believe I still have  
2 them.

3 Q. Okay. I'd just ask you to maintain those,  
4 please, and we'll have to consider what, if anything,  
5 to do about this at another time.

6 I just want to clarify, the -- the  
7 materials that you did receive, it wasn't a report or  
8 evaluation or data of any type that that other  
9 consulting expert provided on the plaintiffs, was it?

10 A. To the best of my knowledge, it was an  
11 un-finalized document and I essentially was not able  
12 to -- I did not use it to draw any con -- conclusions,  
13 I did not use it to make any assumptions, and I  
14 started over and completed completely independent  
15 evaluations. And the reason I don't mention it in my  
16 reports as well is because I didn't reference it.

17 Q. Okay. So I'll just ask you to hold on to  
18 that and segregate out whatever those materials are,  
19 and, you know, so that we have -- we know what they  
20 are for a future time. And with that, I just want to  
21 finish up the questioning on this document that I hope  
22 is still on the screen.

23 Is this the -- the -- well, let's make  
24 sure there is nothing else. So we were on Paragraph 9

1 and I was asking about, and this is what caused --  
2 prompted the break for the separate communications  
3 with the counsel there, correspondence between you and  
4 other consultants retained for the plaintiffs.

5           Apart from what you just told us about  
6 this one consulting expert, did you have any  
7 correspondence or communications or receive any  
8 information from any other consultants for the four  
9 bellwether plaintiffs?

10           A. I am not aware of having received any  
11 other correspondence or communication.

12           Q. Okay. And then the last paragraph asks  
13 for, this is actually language, I think, right from  
14 the court order that we worked out on this, and it  
15 says:

16           "The complete and unredacted raw data,  
17 test forms, test protocols, test reports, computer  
18 printouts and examinee and informant response sheets  
19 for the tests and evaluations administered concerning  
20 the bellwether plaintiffs T[PPI], V[PPI], W[PPI] and  
21 S[PPI]."

22           And have you produced all of that  
23 information to us and we've marked those as exhibits  
24 during the deposition?

1           A.       To the best of my knowledge, yes.

2           MR. ROGERS:   Okay.   That -- those are all of the  
3   questions that I have for you.   Thank you very much  
4   for your cooperation and patience over the last day  
5   and a half, and I'm wondering if the other defense  
6   counsel have questions and maybe if we could just go  
7   ahead and finish at this time.

8           MR. GAMBLE:   This is Travis Gamble on behalf of  
9   the LAN defendants.   In light of your completely  
10   thorough examination of the witness, LAN has no  
11   additional questions for Dr. Krishnan at this time.

12          MR. ROGERS:   Okay.   Thanks, Travis.

13                 I -- I noted that Bill Kliffel was on the  
14   Zoom conference yesterday.   I don't know if he is on  
15   today.

16                 Is there -- are there any other defense  
17   counsel, City of Flint or otherwise, who -- who want  
18   to ask questions?

19          MR. KLIFFEL:   Hey, David, can you hear me?

20          MR. ROGERS:   Oh, there you are.   Okay, Bill.  
21   Yep.

22          MR. KLIFFEL:   I do have some questions.   I  
23   wouldn't be too long.

24          MR. ROGERS:   I'm going to go off and mute.

1 Thanks, Bill.

2 MR. KLIFFEL: And, David, could you take down  
3 your document, the deposition notice. That seems to  
4 be -- having trouble seeing the full screen.

5 Great. Perfect.

6 EXAMINATION

7 BY MR. KLIFFEL:

8 Q. Dr. Krishnan, my name is Bill Kliffel. I  
9 represent the City of Flint.

10 Can you hear me okay?

11 A. I can, yes.

12 Q. Okay. If at any time you can't, let me  
13 know. I've tried to strike from my notes anything  
14 that's been covered, so I'll try not to cover anything  
15 twice.

16 Just some questions about the four  
17 bellwethers that we've been talking about that came to  
18 my mind as we've been, you know, discussing the last  
19 two days.

20 Can -- can a death of a close loved one in  
21 a family affect a child's performance at school or  
22 affect their behavior?

23 A. Are you asking that question with respect  
24 to these four children or as a general question?

1 Q. Generically for the moment.

2 A. Yes, it can.

3 Q. Okay. Were you aware that EPPI SPPI  
4 great grandmother, who was only 69 years of age, died  
5 in May of 2019?

6 A. I would have to go back to my report.

7 I -- I'm not sure if I was aware of that or not.

8 Q. Okay. Would that have had any impact on  
9 your assessment of his behavior or of the condition  
10 that you diagnosed him with?

11 A. If you -- is it all right if I take a  
12 quick look at my report?

13 Q. Yes.

14 A. I believe -- to the best of my knowledge,  
15 that's not something I was aware of. When did you say  
16 this happened?

17 Q. May 22nd, 2019.

18 A. So this is not something that -- that came  
19 up in the discussion I had with this family. I --  
20 I -- I have a hard time saying, you know, therefore,  
21 how much of an impact it makes. They did not really  
22 describe significant emotional changes or problems for  
23 EPPI and I did not primarily base my finding based on  
24 school problems for EPPI. I would generally not

1 expect a death in the family to have a significant  
2 effect on neurocognitive testing.

3 Q. Okay. Fine.

4 Now, with respect to APPI TPI there  
5 is a reference in her mother's deposition transcript  
6 to her being diagnosed with bipolar disorder, but my  
7 question is more generic.

8 Would a parent having been diagnosed with  
9 bipolar disorder impact your opinions about the  
10 conditions you diagnosed in APPI TPI or not?

11 In other words, you said ADHD among the  
12 siblings didn't impact your opinion because you didn't  
13 find that she had classic ADHD. So, what would a  
14 bipolar diagnosis in a parent do to impact your  
15 opinions, if anything?

16 A. So, again, bear with me a moment, please.

17 In APPI TPI case, if I remember  
18 correctly from the -- not changing any previous  
19 answers that I gave, but if I remember correctly from  
20 the discussion, there was this -- this -- there was a  
21 discussion of the family history that I understood and  
22 anxiety and that I didn't think that that was a  
23 relevant factor in the mood disorder diagnosis that I  
24 gave, but I do think that a mood disorder would

1 have -- there is a potential for heritability on the  
2 basis of a parental diagnosis of bipolar disorder,  
3 assuming that that diagnosis is accurate.

4 Q. Okay. And then could the behaviors that  
5 could be manifested in a parent as a result of having  
6 bipolar disorder, in other words, that condition in  
7 addition to being a possible heredit- -- hereditary  
8 link for the child, could that parent's behavior and  
9 the environment created by that behavior also have an  
10 impact on the development of the child from a  
11 neuropsychological standpoint?

12 A. I can say that that is possible. I am not  
13 able to comment on the probability of that. I did not  
14 evaluate APPI mother, of course, but I was not  
15 aware in interacting with APPI and her mother --  
16 I -- I did not -- did not come across significant mood  
17 instability for the parent that would raise a concern  
18 of that kind.

19 Q. Okay.

20 A. But I do think that that is possible.

21 Q. Okay. I'm sorry for interrupting you.

22 And your interaction with the mother took  
23 place again over about an hour, hour and a half and  
24 then you had the benefit of her completing the

1 Vineland and the BASC-3, correct?

2 A. That's correct.

3 Q. Okay. All right. Moving now onto R[PPI]

4 v[PPI].

5 I was interested to know -- in your report  
6 you mentioned that R[PPI] had actual eye or visual  
7 issues.

8 Do you know how back her diagnosis of  
9 visual issues went, based on your report?

10 A. Just a moment, please.

11 I -- I am not aware. If I read you the --  
12 the sentence from my report: "R[PPI] has just been  
13 referred to see an eye doctor, so this is pending.  
14 Her pediatrician was not actually concerned, but she  
15 did fail a school test."

16 I -- if I understood what it -- what I was  
17 privy to, if I understood it correctly, she had  
18 relatively recently failed a school test and so the  
19 family was planning on obtaining an eye -- an  
20 optometrist or ophthalmologist evaluation, but I don't  
21 know the history of her, any visual problems.

22 Q. Okay.

23 A. I don't actually know, in fact, if she had  
24 any visual problems.

1 Q. Okay. Can visual problems or visual  
2 acuity problems have an impact on academic performance  
3 as a general question?

4 A. In general there are situations where that  
5 happens. That is part of the reason, to my  
6 understanding, that schools complete vision screens.  
7 It is really common for a child to need eyeglasses or  
8 contact lenses when they are sitting in the back of  
9 the classroom and they realize they can't read the  
10 school board and everybody else can. That is, in  
11 fact, how I started wearing glasses myself.

12 It would generally not be expected to have  
13 a sustained impact just because schools are doing  
14 vision screening and giving parents the feedback, as  
15 in this case the parents were planning on doing an  
16 evaluation.

17 Q. Okay. Can vision issues impact or affect  
18 the outcome of tests like the WISC-V or other testing  
19 that you did in RPPi situation, because -- and the  
20 reason I'm asking is you note that she has a visual --  
21 she had visual issues that were manifested through  
22 your testing.

23 Am I correct on that, she had visual  
24 spatial issues?

1           A.     Oh, I see. So these are visual reasoning  
2     issues. They are -- they are based on interpreting  
3     visual information, but the -- these are information  
4     processing problems. They happen in the brain and not  
5     in the eyes.

6           Q.     Okay. So the eyes -- excuse me. The eyes  
7     cannot affect the way that you take in and then  
8     process information, if your eyes are very poor?

9           A.     If your eyes are very poor, yes, but I  
10    didn't see any evidence that was suggestive of that  
11    when I evaluated her.

12          Q.     Okay. Okay. Now, moving on to D[PPI]  
13    W[PPI]. Can a move of a family residence have an impact  
14    on a child's behavior in school and performance in  
15    school?

16          A.     Yes, that is possible.

17          Q.     Okay. Do you know that her family moved  
18    in October of 2018, which is, you know, a good portion  
19    of the way through the first semester of that year?

20          A.     That came up in the deposition transcript  
21    that I reviewed for her family.

22          Q.     Okay. And another thing, excuse me, wow,  
23    I'm glad we are not in the room together, I guess,  
24    today.

1 I also noticed in D PPI W PPI  
2 deposition transcript that I asked her about screen  
3 time and her mother told me she had two to three hours  
4 of screen time on devices during the school year and  
5 six to eight hours in the summer months.

6 Is screen time a significant thing in your  
7 mind as a neuropsychologist in terms of the way people  
8 act or the way that they interact with people or not?

9 A. So, it is a topic of -- it is a hot topic  
10 or a topic that psychologists are discussing. I'm not  
11 aware of any high quality study that a -- that  
12 associates -- that provides, like, a dose response  
13 kind of relationship between screen time and cognitive  
14 or emotional functioning. In D PPI case, there  
15 was a question of -- excuse me. I -- I -- I'm  
16 thinking of somebody else.

17 I -- I -- I would not recommend that  
18 children have that much screen time, particularly the  
19 higher number that you said, but I -- I don't recall  
20 any information that I reviewed with the family that  
21 suggested that that contributed to what I was seeing.

22 Q. Okay. And -- and did her parent or  
23 parents express any concern to you about the amount of  
24 screen time that she had? I didn't see that in your

1 report specifically, but do you remember that?

2 A. No, I don't, I do not remember that.

3 Q. Okay. All right.

4 I'm going to switch gears a little bit,  
5 and some of these questions are kind of basic, but I'm  
6 going to try and pare out the ones that may not be  
7 necessary, so just bear with me.

8 In your clinical practice when a child  
9 comes to you and there is a -- you know, a  
10 doctor/patient relationship and when you administer a  
11 complete neuropsychological examination, how long  
12 face-to-face do you spend with the child that you  
13 are -- in your clinical practice for that sort of an  
14 evaluation?

15 Here you said two to three hours give or  
16 take. How long does it take in your practice?

17 A. If -- so these -- these evaluations, aside  
18 from the -- the nature of the records review are  
19 largely similar to what I would do for a similar  
20 clinical situation. The reason I'm answering that way  
21 is I do participate in different kinds of clinics. I  
22 participate in some team care clinics where I have a  
23 relatively tight constrained amount of time. In that  
24 setting I only have about an hour and a half with each

1 patient, but in general what I would say is that my  
2 evaluations here are fairly comparable to what I would  
3 do in a clinical setting for children of this age. I  
4 would shoot for around three or maybe four hours of  
5 cognitive testing. I would spend about an hour to an  
6 hour and a half with the parents. And I would  
7 typically give a same-day feedback that would consist  
8 of an hour or two or so as well.

9 Q. Okay. Now, the battery of tests that you  
10 selected for these bellwether, these four bellwether  
11 children we are discussing, they are pretty similar,  
12 and there are a couple where you added one or took one  
13 away.

14 My question is in your clinical settings,  
15 are the batteries that you are using there pretty  
16 similar to these or were these varied and changed up  
17 compared to what you normally do?

18 A. So in general these are all tests I use in  
19 my clinical setting. And -- and so, again, if I saw a  
20 child similar to these four children, I may well give  
21 exactly the same battery, depending on the time  
22 constraints, it might be slightly longer or shorter.

23 The only exception I would give is, again,  
24 in some of those settings where I'm working with

1 children and I have a very short amount of time, I --  
2 so we didn't discuss effort testing in great detail,  
3 but I did include effort testing in all of these  
4 evaluations. I -- I always in -- incorporate some  
5 kind of measure or validity or effort in medical/legal  
6 evaluations. I almost always do that in clinical  
7 settings, as well, unless the appointment is very  
8 short and there -- and the time is precious.

9 Q. Okay. Now, under the WISC-V, are there  
10 five cognitive domains?

11 A. That's not the reason it's a "V," but,  
12 yes, that's correct.

13 Q. Okay. So what does the "V" pertain to? I  
14 probably have it wrong.

15 A. No. No, sir. It's the fifth edition of  
16 the test.

17 Q. Okay. Well, no, my -- my question is how  
18 many cognitive domains are tested for under the  
19 WISC-V?

20 A. As it happens, the answer is also five.  
21 So, I don't want the -- I don't want to get too far in  
22 the weeds unless you really want me to.

23 The WISC-V is a measure of general  
24 intellect. In psychological literature that construct

1 is sometimes just referred to as G, and IQ is a  
2 measurement of G. G is a measure of -- it is  
3 something like a measure of overall thinking health.  
4 If you had to pick one number that characterized a  
5 person's cognitive abilities, then -- then this G or  
6 IQ is the number you would choose.

7 The way that -- I'm not an expert in -- in  
8 designing IQ tests, but the way that IQ tests are  
9 designed, generally speaking, is that all of the  
10 subtests administered are highly correlated with each  
11 other, meaning that the performance is very similar on  
12 one to another. The reason many subtests are  
13 administered is because by administering many corl- --  
14 highly correlated tests you derive a more accurate  
15 estimate of IQ, intelligence quotient or this  
16 quantitative measurement of this G factor.

17 However, although these tests are highly  
18 correlated, if you do something that statisticians  
19 call factor analysis, then these tests that are highly  
20 correlated fall into slightly different sets of  
21 thinking skills. In the case of the WISC-V, it breaks  
22 into five skills, older versions of this test broke  
23 into a smaller number of these domains. Briefly those  
24 domains are verbal comprehension, visual and spatial

1 construction, fluid reasoning, working memory, and  
2 processing speed, and so those are the reasons that  
3 the subtests are listed in five rows in my score  
4 summary.

5 Q. Okay. Okay.

6 Now, can you make a comment based on a  
7 single subtest of one of the domains of the WISC-V in  
8 terms of the performance and that domain or should you  
9 do more than one subtest from that domain to make a  
10 comment on performance?

11 A. So, I obviously cannot speak for all  
12 neuropsychologists, but in general in my experience  
13 neuropsychologists view IQ tests as being a small  
14 subset of their arsenal. If anything, I'm usually  
15 trying to spend less time measuring IQ and more time  
16 measuring other things. The reason for that is that  
17 IQ is a measure of general cognitive health, but in  
18 general we are asked to see people because they have  
19 specific kinds of problems.

20 With that being said, these tests vary a  
21 little bit in duration and complexity, but as a  
22 general practice, I look for overlapping corroborating  
23 information from multiple tests, and I think that I  
24 mentioned this several times to Mr. Rogers, to his

1     chagrin, to some extent, but I avoid reading  
2     individual tests in isolation as a general matter of  
3     practice.

4           Q.     What is the range of normal IQs in  
5     children?

6           A.     That depends a little bit on how you  
7     define normal.  IQs are distributed on a Gaussian,  
8     G-a-u-s-s-i-a-n, or normal or bell curve distribution,  
9     meaning that there is no sharp distinction between an  
10    IQ that is normal and abnormal.  Neuropsychologists  
11    typically consider 1.3 standard deviations below the  
12    mean to be -- as a -- as a common level that is  
13    inferred to be impairment.  That's -- in the IQ metric  
14    that's 80, and so using that standard 80 to 120 would  
15    be normal.

16          Q.     Okay.  Now, does IQ testing and the  
17    results for that testing, does that get more accurate  
18    as children get older or conversely is it less  
19    accurate when the children are younger?

20          A.     That's an excellent question.

21                   Generally speaking, IQ becomes more stable  
22    over time.  IQs for young children, and by "young" I  
23    mean probably less than about six years of age, are  
24    not as effective as long-term predictors.

1           Q.       Okay. And then if you took one child and  
2       you tested them in year one and they were let's say  
3       like eight years old and you tested them a year down  
4       the line, how much variability is there in IQ testing  
5       of the same student or the same subject across two  
6       tests?

7           A.       That's a good question. I have to  
8       decompose that into two slightly different questions,  
9       if you -- if you'll bear with me.

10                 So, neuropsych -- I apologize, too, the  
11       sun is shining just now and I want you to be able to  
12       see me.

13                 Neuropsychological tests, generally many  
14       of them have susceptibility to something called  
15       practice effects. It just varies from test to test,  
16       but what a practice effect means is that if you do a  
17       test and then you take the test again, then you do  
18       better the second time than you did the first time.  
19       For reasons that I think are apparent.

20                 In general, IQ tests have known practice  
21       effects. I don't have those statistics right in front  
22       of me, but those -- the practice effect size is on the  
23       order of a third to half of a standard deviation. And  
24       that diminishes over time, and so the further away the

1 less the size of that is.

2 But then the second question is how -- how  
3 accurate are the IQ measures to begin with and -- and  
4 so scientists if they use kind of like this artificial  
5 reality in that kind of question if I -- if I consider  
6 one of these children I imagine that I have ten clones  
7 of the same child, right, and -- and ten clones of  
8 myself and the ten of me evaluate the ten of them so  
9 that each of them only do the IQ test once. If that's  
10 not too absurd to imagine.

11 Then the question is, like, how similar  
12 would their IQs be, right? In a perfect world we  
13 would imagine that their IQs would be the same.  
14 Generally speaking, that range is relatively small.  
15 It's probably on the order of a third of a standard  
16 deviation, to my recollection.

17 Q. Okay. All right.

18 Switching gears just a little bit, to what  
19 extent, if any, do you believe that this COVID  
20 pandemic has impacted your ability or any -- any  
21 neuropsychologist's ability to test for IQ? Did it  
22 have any effect on the testing of these four, for  
23 instance, that you can tell us about or not?

24 A. So, as -- as Mr. Stern alluded to earlier

1 in the deposition, the time that I was retained was  
2 during the acute pandemic. Michigan was at a  
3 stay-at-home order, as you know, at that time, and  
4 there was a period of time in which  
5 neuropsychologists, most neuropsychologists were not  
6 completing evaluations at all, and, in fact, the  
7 evaluations that were done were close in time to the  
8 earliest timeframe that it was safe to do these kinds  
9 of evaluations again.

10 In my clinical practice, I did make  
11 adaptations to my battery to reduce the amount of  
12 paper that children came physically into contact with  
13 or other physical stimuli that the children came into  
14 contact with, but in terms of administering an IQ  
15 test, I did not observe any major barriers. We looked  
16 for things like increased close mishearing, right, and  
17 so if -- if I say blood and you think I said flood or  
18 vice versa, I'm just picking random words that sound  
19 similar to each other, that would be my cue to think  
20 maybe like this would be something that was caused,  
21 for instance, by the fact that I'm wearing a mask.  
22 And I didn't really see any significant issues in that  
23 regard. They would pop up less in the WISC and more  
24 in tests like this California Verbal Learning Test,

1 and I really didn't see anything that was unusual, and  
2 so I'm not sure that there have been careful  
3 scientific studies on neuropsychologists administering  
4 tests during COVID, but I don't believe that COVID had  
5 a significant impact on the test outcomes.

6 Q. Okay. Doctor, does the literature say  
7 what component of IQ is hereditary?

8 A. Generally speaking, IQ is fairly  
9 hereditary in most individuals, and so there -- there  
10 are -- you know, there is significant literature about  
11 the inheritability of IQ and it is moderate in nature.

12 The -- the -- typically moderate means  
13 there is still a significant amount of variance that  
14 remains for other factors.

15 Q. Okay. Does the literature land at -- at  
16 any level does it say 30 to 80 percent or 50 percent  
17 or anything like that that you can tell us about right  
18 now or not?

19 A. I would have to review the literature.

20 Q. Okay. All right.

21 The -- the article that Mr. Rogers put on  
22 that we talked about a little bit talked about some  
23 factors that can impact IQ.

24 Does a supportive home environment impact

1 IQ and IQ-related performance?

2 A. I think in general factors such as the  
3 level of environmental stimulation have a substantial  
4 effect on IQ.

5 Q. Okay.

6 A. The research on that has gone back and  
7 forth, but so an enriched environment is generally  
8 conducive to higher levels of IQ. The complication  
9 for psychologists in answering that question has been  
10 that traditionally enriched environments are also more  
11 often provided by high SES individuals who are high  
12 S -- socioeconomic status -- because they are also  
13 high IQ to begin with, and so the -- the nature and  
14 nurture kind of tease out is difficult in that case.

15 Q. Okay. So I guess a corresponding question  
16 would be: Are you suggesting that things like reading  
17 aloud with your children, playing math games, maybe  
18 watching different sorts of more educational higher  
19 quality TV, are those the sorts of things that would  
20 be a good home environment that would foster IQ or the  
21 development of IQ?

22 A. They generally foster the development of  
23 positive cognitive skills. I -- I am not sure how  
24 large of an effect they have on IQ, but they are

1 certainly -- I -- I would -- if I -- for my own child,  
2 you know, my approach would be to talk to them a lot,  
3 read to them and -- and minimize television, yes.

4 Q. Okay. Switching gears again a little bit,  
5 when you look at attention disorders or ADHD, I think  
6 that -- and tell me if I'm wrong, but I think the  
7 Vineland and the BASC-3 are very useful tools that you  
8 used to try to find out if there are those sorts of  
9 issues with the child.

10 Did I get that right or did I -- did I get  
11 that wrong?

12 A. No, I think you got that correct.

13 Q. Okay. Now, typically in your clinical  
14 practice, if you had a parent come in and you were  
15 testing a child and you did the Vineland and the --  
16 and the BASC-3 with the parent, would there typically  
17 be a corresponding test that you might send to a  
18 teacher or an educator or a counselor at school to get  
19 a corroborating opinion that might or might not  
20 dovetail into the parents' opinions?

21 A. That is very helpful. By tradition the  
22 expectation for ADHD is that it presents in multiple  
23 settings. The -- in a -- in a clinical setting the  
24 biggest challenge is modern expectations for

1 turnaround time. I -- I -- I generally give parents  
2 feedback on the date of the evaluation. I -- the  
3 physicians as well as the parents are expecting  
4 relatively rapid turnaround and oftentimes getting  
5 teacher reports is somewhat unpredictable. What we do  
6 in the clinical setting to manage that is, one,  
7 oftentimes pediatrics before they refer children to  
8 neuropsychology has already done that, and so  
9 certainly we take that into account.

10 If we can't get the psychometric data,  
11 then we look at, you know, anything else that the  
12 school is able to provide, but certainly, yes, I do  
13 think that that is a good practice when it is  
14 possible.

15 Q. And for these four bellwethers that we are  
16 talking about, the closest you came to that, I would  
17 imagine, would have been whatever the school records  
18 divulged or the report cards.

19 Is that a fair statement?

20 A. Correct.

21 Q. Okay.

22 A. Of anything that came up. Yeah, the --  
23 the only direct testimony from the school was the  
24 educational records that I reviewed in my reports.

1           Q.     Now, with respect to these four  
2     bellwethers we are talking about, you don't have any  
3     IQ information on their biological parents, do you?

4           A.     I do not, to my -- the best of my  
5     knowledge.

6           Q.     Now, A[PPI] T[PPI], she had, I believe, a  
7     fraternal twin.

8                     You don't have any IQ data on her  
9     fraternal twin, do you?

10          A.     I do not.

11          Q.     Okay. I saw that you -- you talked about  
12     the TMT a little bit earlier over the last two days.

13                     That's quite an old test, isn't it,  
14     developed for the Army? Wasn't that developed in the  
15     1940s?

16          A.     I think that that's correct. There are  
17     some neuropsychological tests that go all of the way  
18     back to the -- even the 1910s or 1920s. Some of these  
19     tests began before -- before there were even measures  
20     like CTs or MRIs that would allow for visual imaging  
21     of the brain, and so some of the early history of  
22     neuropsychology was identifying brain injuries when  
23     there were no other available corroborating tools.

24          Q.     Okay. And I think you told us that the --

1 the TMT has been normed and you gave us that  
2 information today, where to find that?

3 A. Correct.

4 Q. When was that normed?

5 A. Yeah, it is -- it is -- oh, I'm sorry.

6 I would have to look back in that report.

7 It would have been within the last 20 or 30 years.

8 Many of these tests are re-normed over time and so the  
9 norms that are being used are not norms from the 1920s  
10 or 1940s.

11 Q. Okay. All right.

12 And then you also used the Tower of  
13 London. The question I had was: You are familiar  
14 with the D-KEFS, the Dallas Kaplan Executive Function  
15 System? I think that's referenced in your summary --

16 A. I am, yes.

17 Q. You didn't -- you didn't administer that  
18 to any of these four children, did you, the D-KEFS?

19 A. I did not use the D-KEFS, no.

20 Q. Okay. Are the -- the TMT and the Tower of  
21 London, are those preferable to you than some of the  
22 subcomponents of the D-KEFS?

23 A. So, I -- I want to be respectful of other  
24 neuropsychologists, both Dean Dallas and -- and Edith

1 Kaplan are incredibly well respected in our field.  
2 Every test has pros and cons. If I talk shop a little  
3 bit, the difference tends to be between the D-KEFS and  
4 some of these other options that the D-KEFS tests tend  
5 to have many different conditions that lengthen the  
6 tests in a way that I don't find very useful. That's,  
7 for instance, with respect to the trail making test.  
8 The -- the standard trail making test has two  
9 conditions and the D-KEFS, I believe, has five.

10 With respect to the Tower of London versus  
11 the -- the Tower of Hanoi that is in the D-KEFS, I  
12 have -- I have used the D-KEFS extensively in my own  
13 training and -- and I use it still sometimes in my  
14 clinical practice. My experience with the D-KEFS  
15 tower is that it provides less useful information than  
16 the Tower of London. And so if I use the term "like,"  
17 I -- I like or find the Tower of London Drexel Edition  
18 to be more useful than the one that's in the D-KEFS.

19 Q. Okay. All right.

20 When you are administering a test like  
21 the -- like the WISC-V, and tell me if I get this  
22 wrong, but I think what you do is you -- you are  
23 testing the child on a certain subcomponent of that  
24 test and if they get two or three wrong, do you then

1 stop and move on or do you prompt the child and try to  
2 get them back and see if they can complete it  
3 successfully?

4 How does that work? Do you do it one way  
5 or the other or is there a mixture?

6 A. So that -- the -- the manual for the  
7 D-KEFS standardizes both of those things, and so,  
8 without getting too deeply into the test security  
9 itself, there are standards for both of them, and  
10 so -- and I follow those and so I provide cues when  
11 there are certain situations where children provide  
12 ambiguous answers and I provide cues to determine if  
13 the -- if -- to make sure I understand how to score  
14 the answer.

15 All of the subtests on the D-KEFS are --  
16 sorry -- all of the subjects on the WISC-V have  
17 discontinuation rules where -- which is the second  
18 thing that you referred to, where when a child gets  
19 items repeatedly wrong, they stop. The exception is  
20 the coding subtest does not have a discontinuation  
21 rule, but -- and I follow those rules as -- as they  
22 are published.

23 Q. Okay.

24 A. In addition to that, you know, informally

1 with children as a standard of care, if children are  
2 responding very quickly or impulsively, I -- I also  
3 provide more informal cues that I understand to be  
4 within the standardization of the WISC and so, for  
5 instance, if there is a series of items where a child  
6 is picking from five options and they keep picking one  
7 immediately, I'll say something like, make sure you  
8 look at all of the options before deciding.

9 Q. Okay. And -- and, again, for the reports  
10 for these four bellwether children, did you overtly  
11 state in your reports whether you were giving them the  
12 cues or is that just understood because it's your  
13 protocol that you would normally follow?

14 A. I -- I believe that it's understood, but  
15 it -- so the cues and the discontinuation rules are  
16 not my protocol. They are the -- the standardization  
17 for the WISC or -- or the test in question.

18 Q. Have you followed those protocols for --  
19 for these tests across these four children?

20 A. I did, yes, to the best of my knowledge.

21 MR. KLIFFEL: All right. Doctor, I believe that  
22 those are all of my questions. So I appreciate your  
23 time and patience. Thank you.

24 THE WITNESS: Thank you.

1 MS. CARO: Are there any other defendants that  
2 have anything that they'd like to ask? Dave?

3 MR. ROGERS: No, I don't have any follow-up.  
4 Thanks.

5 MS. CARO: Okay. I just have a few follow-up  
6 questions.

7 EXAMINATION

8 BY MS. CARO:

9 Q. Doctor, are you aware of any literature  
10 that concludes that bone lead levels are not reliable?

11 A. I am not.

12 Q. And what is your understanding of the  
13 reliability of the bone lead level test?

14 A. My understanding is that they have a  
15 measurement error and if I remember correctly the bone  
16 lead levels that I was provided for these children  
17 included the measurement error and so they would say  
18 something like, this child had 1.5 micrograms per gram  
19 with a measurement error of 1.1, meaning that -- that  
20 the possibility of a zero level could be excluded.

21 My understanding is that the -- all of  
22 the -- all of the bone lead levels were above the  
23 measurement error in these four children.

24 And then, in general, I understand that

1 bone lead levels act as an integrator or aggregator,  
2 meaning that they provide a -- a more long-term stable  
3 level with less fluctuation than blood.

4 Q. Can you remind us and state on the record  
5 what the bone lead levels were for each of the four?

6 A. If you bear with me, yes, I would be happy  
7 to.

8 These are -- these are to the best of my  
9 knowledge from my review of the records that I was  
10 provided.

11 For EPPPI SPPI, I understand that there  
12 was an 8/24/19 bone lead density assessment with the  
13 result of 6.72 micrograms per gram.

14 For APPI TPPI, I understand that there  
15 was an 8/15/19 bone lead assessment with a result of  
16 9.65 micrograms per gram.

17 For RPPI VPPI, I understand that  
18 there was an 8/15/19 bone lead density of  
19 5.58 micrograms per gram.

20 For DPPI WPPI, I understand that there  
21 was a 2/14/20 bone lead density of 5.46 micrograms per  
22 gram.

23 Q. Thank you.

24 Were all of the bone lead level tests

1 consistent with the impairments you found in the  
2 testing, in your testing?

3 A. All of these children I read as having  
4 abnormal neuropsychological results. Those results  
5 are, I believe, within the range of the kinds of  
6 impairments that are seen in children with this level  
7 of lead exposure.

8 Q. And you testified that lead leaves the  
9 body through urine excretion and that you expect over  
10 time attenuation of deficits.

11 That's not the same as to say that there  
12 may not be permanent damage, is that correct?

13 A. That is correct.

14 Q. Or that there could be long-term negative  
15 outcomes, is that also correct?

16 A. That is also correct.

17 Q. Could you elaborate on what kinds of  
18 permanent damage may be caused by the lead levels  
19 that -- that we experienced here and some of the  
20 long-term health outcomes that -- that could occur?

21 A. So, within my area of expertise having to  
22 do with cognitive and emotional functioning, there is  
23 a really broad range of impairments seen, although  
24 among the more common impairments are impairments in

1 things like attention and executive functioning,  
2 impairments in visual and spatial skills and mood and  
3 learning problems.

4 Q. And are these things --

5 A. And so if I understand your --

6 Q. Go ahead. I'm sorry.

7 A. Sorry.

8 And so the -- the -- the concern is that  
9 these would generally maintain over time and continue  
10 to -- to limit the children. It's possible that they  
11 would improve, but there are also situations where  
12 they get worse in the form, not of getting worse in an  
13 overall sense, but as discussed in the reports in the  
14 case of something like nonverbal learning disorder,  
15 oftentimes that becomes evident once a child is at a  
16 certain academic level and it's not impaired -- not as  
17 apparent in testing at this age.

18 Q. And could that be something that's --  
19 could those kinds of types of outcomes, can they be  
20 permanent in nature?

21 MR. GAMBLE: Object to form, foundation.

22 BY THE WITNESS:

23 A. Yes, they can.

24 MS. CARO: Okay. Thank you very much. I have

1 nothing further.

2 THE WITNESS: Thank you.

3 MR. KLIFFEL: Dr. Krishnan -- oh, go ahead,  
4 David.

5 FURTHER EXAMINATION

6 BY MR. ROGERS:

7 Q. Yeah, I do have a -- sorry. Let me start  
8 the video. I do have a couple of follow-up questions  
9 on the blood lead tests, Dr. Krishnan. And it  
10 involves the date on which the tests were conducted.

11 So, let me share -- so in your report you  
12 have described or identified the dates on which the  
13 bone lead tests -- bone scans were done, right?

14 A. Correct.

15 Q. Do you know where you received that  
16 information, because I'm going to share my screen with  
17 you now, and I will show you as an example the bone  
18 lead result report that we were provided for EPPI  
19 SPPI and you can see here this is the whole  
20 report, and it has a date of birth and it has the  
21 results and so forth, but it doesn't have the date it  
22 was performed.

23 So, where did you obtain -- do you -- do  
24 you have bone lead result reports that are different

1     than this or where did you obtain the information  
2     about the date on which they were done, the dates on  
3     which they were done?

4           A.     No, I think you are correct, and I  
5     apologize if I misspoke earlier unintentionally. I  
6     believe that that was provided via separate -- that  
7     may have been provided via a separate communication,  
8     and I would be happy to -- to provide that back to the  
9     attorneys to provide to you.

10          Q.     Well, what I'm really interested in is  
11     if -- if you wouldn't mind checking with respect to  
12     these four plaintiffs in your file materials, I think  
13     we covered this yesterday, but I just want to make  
14     sure, do you have something in addition to this  
15     concerning the bone lead testing that was done on EPPI  
16     SPPI, for example? I want to make sure that there  
17     is nothing else there related to these bone lead tests  
18     that -- that we don't have that you have.

19                 So if you wouldn't mind, can you -- can  
20     you open up your file on SPPI and go to the section  
21     where you have the bone lead results and just see if  
22     there is anything else in there besides this document  
23     that's on the screen?

24           A.     Again, I apologize. My memory is actually

1     that I was provided, now that you mention this issue,  
2     I was provided a spreadsheet by the counsel and so  
3     this requires me to amend an answer that I previously  
4     provided you.

5                 I was provided a spreadsheet by counsel  
6     that clarified the dates of the bone lead results  
7     because I -- I asked the same question myself.

8                 Q.     Okay. But let's -- let's just be clear.

9                 So, do you have in your file this document  
10    that's up on the screen now, the bone lead result  
11    report for EPPPI SPPI

12                A.     Well, let me look.

13                Yes, I do.

14                Q.     And in addition to that, you mentioned a  
15    spreadsheet.

16                Is that a spreadsheet that has -- well,  
17    tell me what the information is on the spreadsheet  
18    that you received? Can you pull that up and just tell  
19    me what's on it?

20                A.     To the best of my recollection, the  
21    spreadsheet had a list of the dates and -- and values  
22    for these bone lead results.

23                Q.     Do you have it that you can open -- find  
24    it and -- and confirm that?

1           A.       Would you like to take a short recess for  
2     that?

3           Q.       Well, we could do that, yes, but with  
4     respect -- would you also at the same time check to  
5     make sure that for the other three plaintiffs, TPPI,  
6     VPPI and WPPI, in addition to the spreadsheet  
7     that you are looking for you don't have anything other  
8     than these bone lead results for those plaintiffs as  
9     well?

10                   Do you understand my question?

11           A.       I -- I am not sure I do. I'm sorry.

12           Q.       Okay. So here we have a bone lead result  
13     report for EPPI SPPI and you just checked and you  
14     said that you have it in your file, right?

15           A.       Correct.

16           Q.       I'm asking you, if you would, please,  
17     check your file materials for the other three  
18     plaintiffs, TPPI, VPPI and WPPI, and confirm  
19     that you have the bone lead test results reports like  
20     this one that's on the screen for SPPI, for them,  
21     and also determine whether there is anything else that  
22     you have by way of records about the bone lead scans  
23     and test results for any of the plaintiffs besides the  
24     spreadsheet that you just described. Okay?

1           A.       Okay.

2           Q.       Okay.  So yeah, you want to -- we'll take  
3   a couple of minute break.  And let's just stay on the  
4   record, we might as well.  I don't care how we -- how  
5   we want to do it.

6           A.       Please give me five minutes to look for  
7   it.

8           Q.       Yeah.  So basically what I'm asking you to  
9   do is see if you can find in your files any  
10   information that you have about the bone lead results  
11   because of what we just discussed, okay.

12           MR. ROGERS:  So let's go off the record for five  
13   minutes.

14           THE VIDEOGRAPHER:  Going off the record,  
15   1:09 p.m.

16                       (WHEREUPON, a recess was had  
17                       from 1:09 to 1:14 p.m.)

18           THE VIDEOGRAPHER:  We are back on record at  
19   1:14 p.m.

20                       All set.

21   BY THE WITNESS:

22           A.       So, thank you for the -- the time to check  
23   my records.

24                       So you asked two questions.  The first one

1 of the questions was whether there were any other  
2 documents in my full records for the -- the children,  
3 these four children that I didn't already mention to  
4 you. I read those documents directly from my folders  
5 and there are not.

6           However, there was a document that was  
7 provided to me by Levy Konigsberg that I didn't put in  
8 my records because it was not about one child but  
9 about all of their clients, and so I apologize for not  
10 mentioning that earlier. The document contains the  
11 bone lead testing dates and I have forwarded that back  
12 to them and they will -- they will be making sure that  
13 there is nothing that they need to redact that isn't  
14 relevant and -- and sending that to you.

15           MR. ROGERS: Okay. Thanks a lot. That's all I  
16 have.

17           MS. CARO: Okay. I have nothing further.

18           THE VIDEOGRAPHER: One moment.

19                   This ends today's deposition. We are  
20 going off the record at 1:16 p.m.

21                                   ---

22                   Thereupon, at 1:16 p.m., on Tuesday,  
23 October 6, 2020, the deposition was concluded.

24                                   ---

1 REPORTER'S CERTIFICATE

2

3 I, JULIANA F. ZAJICEK, a Registered  
4 Professional Reporter and Certified Shorthand  
5 Reporter, do hereby certify that prior to the  
6 commencement of the examination of the witness herein,  
7 the witness was duly remotely sworn by me to testify  
8 to the truth, the whole truth and nothing but the  
9 truth.

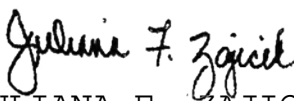

10 I DO FURTHER CERTIFY that the foregoing is  
11 a verbatim transcript of the testimony as taken  
12 stenographically by me at the time, place and on the  
13 date hereinbefore set forth, to the best of my  
14 availability.

15 I DO FURTHER CERTIFY that I am neither a  
16 relative nor employee nor attorney nor counsel of any  
17 of the parties to this action, and that I am neither a  
18 relative nor employee of such attorney or counsel, and  
19 that I am not interested directly or indirectly in the  
20 outcome of this action.

21 IN WITNESS WHEREOF, I do hereunto set my  
22 hand on this 22nd day of October, 2020.

23
